LOOK!!!

What is included with Gasteiner Hard Drives is the Toplink SCSI external controller for all Atari ST computers

All NEW GASTEINER Hard Drive for Atari ST, STFM, STE, MEGA ST, MEGA STE & the formidable FALCON 030.

Award winner for BEST HARDWARE 1993 - ST Review

The All NEW GASTEINER Hard Drive has all the following features:

- 1, Auto Booting and Auto Parking
- 2, Front On/Off switch
- 3, Power indicator (LED) light
- 4, SCSI icon selector switch
- 5, Sleeve bearing Fan (17CFM)
- 6, Dual SCSI Port
- 7, Internal 5% Tolerance P.S.U. (90-260 VAC)
- 8, Top Quality Formatting and Partitioning Software
- 9, New Compact Case (4.00x4.64x9.00) (HxWxD)
- 10, 12 Months back to base guarantee

All the drives for STFM come with all connecting leads including top link

(1) EXPERIENCE

With over 20 man years experience in the Atari Computer market. Servicing many happy customers (over 10,000) we are the foremost manufacturers of Atari Hard Drives.

(2) DESIGN

Using the latest C.A.D. Technology we consider Power Supply design, Air Flow characteristics and Drive Specifications, combined with innovative manufacturing processes, ensure that we can produce the most reliable products to the highest standards.

(3) TESTING

Following the initial design process all our products are subjected to an in-depth testing procedure including mechanical and electrical tests, while thermal Trials ensure the reliability of any configuration in every possible environment.

Repair service

New service/centre for most Atari computers. We offer a quotation service of £10 for which we will examine your computer and report back with an exact quotation price for the repair. If the repair is carried out the £10 is then deducted from your bill.

How to order

When ordering by telephone please quote your credit card number followed by the expiry date and also your full name and address, if paying by cheque please make it payable to Gasteiner Technology. In any correspondence please quote a phone number and also a postal code, please allow five working days for cheque clearance.

Delivery charges

Small consumables and software items under the value of £50 please add £3.50 P&P. Other items except lasers, next day courier service £10 per box. Offshore and highlands, please call for a quotation. In addition, we offer the following express services: Saturday delivery normal rate plus £15 per box, Morning next day, normal rate plus £10 per box. E&OE Prices subject to change without prior notice. All trademarks acknowledged.

Get your ST animated! 13 pages crammed with top tips, tutorials and walkthroughs showing you how to create cartoons, 3D models and video animations. To get started in the world of desktop moviemaking flick straight to page 14.

ANIMATE!

ST First Aid

Your ST is delicate piece of high-tech kit and just one accident can spell disaster and big bills. Discover how to keep your ST healthy with our ST First Aid course, page 67.

Share and Enjoy

Software pirates are ripping off both shareware authors and you! Frank Charlton investigates the shocking extent of shareware theft and piracy on page 74. Read it and get all heated.

FEATURES

- 14 ANIMATE!**
Discover how to make your own animated movies from the comfort of your Desktop. With 13 tip-packed pages to tell you how it's time to get animated!
- 56 DESKTOPPER**
Fancy trading in your ST's tatty plastic shell for a slick metal case? Then you'll want a DeskTopper, and our complete photoguide to fitting one.
- PERFECT PROGRAMMING**
- 58 PENETRATING PASCAL**
The insiders' guide to getting the most from Perfect Pascal. This month's mission: build a database.
- PERFECT PROGRAMMING**
- 62 GFA EXPLAINED**
Banish those BASIC blues. Get to grips with GFA Basic courtesy of Simon Forrester.
- 67 ST FIRST AID**
Keep your ST fit and healthy with these vital tips.
- 74 SHARE AND ENJOY**
Shareware piracy: exactly what it means to you, me and the future of the ST.
- 83 WHAT A LONG STRANGE YEAR IT'S BEEN**
1994 and all that. What happened, who to and why!

ST Answers

"The doctor will see you now." Clive Parker cures all your ST ills. The prescription's on page 50.

REGULARS

6 COVER DISK

The complete step-by-step guide to getting the most from all the splendid ST software crammed on to this month's tasty Cover Disk.

11 NEWS

If it's happened, it's here. The lowdown on the latest news in the Atari and ST scene, including: Jaguars for £200 and off-the-shelf PD...

50 ST ANSWERS

Clive Parker gets his helpful head on and answers your questions and queries on ST software, hardware, firmware, shareware, licenceware, tupperware etc.

70 READER ADS

Your chance to sell, buy, swap and other things ST with 40,000 avid Atari fans. And it's all free. Check it out for some serious bargains.

71 ST DIRECTORY

Phone numbers, addresses and e-mail numbers of everybody who's somebody in the ST world - and a few who are just somebodies, for good measure.

72 SUBSCRIBE!

The easiest and cheapest way to get your copy of ST FORMAT. Save some serious cash and a walk to the shops every month. Go on, subscribe!

78 GAMEBUSTERS

The game guide you've been gagging for! *Starball* exploded, explained and otherwise laid bare. Oh, and some tips for a game called *Premier Manager 2* as well.

■ You all know what game this is, so turn to page 78 and find out why this pic's here.

82 READER OFFERS

When I click my fingers you will wake up, turn to our splendid Reader Offer pages, take out your credit card and buy yourself some essential ST goodies. Click!

87 FEEDBACK

Your letters, your opinions, your points of view and Trenton Webb's so-called 'witty' replies. Well, three out four ain't bad really!

90 TWILIGHT ZONE

The end is nigh! About .23mm nigh to be precise (what? - everyone else). Your last ST stop before the back cover. Fill up with all those odd ST things now.

■ What a surprise! A *Star Trek* piccjo, except this time it's been drawn by a reader.

REVIEWS

Don't spend a penny (ooer!) until you've read this month's vital reviews. All the facts, opinions and programs that matter get the ST FORMAT review treatment.

29 METAMORPHOSIS 24

The latest morphing technology hits the ST. *Metamorphosis 24* may be cutting-edge code, but can it cut it in the world of ST video effects?

34 GAME PREVIEWS

Stardust, *Obsession* and *Team* - three incredible new games due out at the beginning of '95 - previewed. Who says there's no games for the ST?

36 VIEW 2

An upgrade for your desktop systems, enabling you to examine documents without having to run the host application. Do we, or do we not, like that?

■ If you think *Art For Kids* is a silly name, just wait till you try the program!

37 ART FOR KIDS

A truly amazing art package that seeks to teach kids by making drawing FUN!!! Stupid sounds, great wads of cut-and-pastable objects and wonderfully solid.

39 STE POWER CD VOLUME 1

More PD and shareware than a growing man can eat - just as long as the man in question has a CD-ROM drive and a German-to-English dictionary.

41 X-DEBUG 1.01

If you write machine code programs you're going to need a top class debug facility. But can *X-Debug* deliver the entomological extermination goods?

42 PUBLIC SECTOR

Frantick, *Violent Death*, *Zuffers*, *Stellar Module Collection 1.1*, *Scorewriter*, *Award Maker Plus*, *Route Finder 2.0*, *Kozmic 4*, *The Ultimate STE Megademo*, *Club Culture Pack 2* By *Kuba* and *Fly Over Fantasy*.

47 THEIR FINEST MISSIONS

Data disk for *Battle of Britain: Their Finest Hour*. The flyboys of WWII go at it again, this time on some of the hardest and silliest missions ever seen or flown.

48 ZERO-5

Simply stunning! A space opera with slick graphics, stunning 3D, brilliant effects and stacks of gameplay too. How impressive? That impressive.

COVER DISK 66 THIS MONTH...

STARDUST: Our playable demo of one level from *Bloodhouse's* stunning STE/Falcon shoot-'em-up. **Size: 228K**

ENDURANCE: Virtual reality on your ST, whatever its memory and whatever its configuration. **Uncompressed size: 319K**

ROUTE FINDER 2.0: Plan those important car journeys so you never get lost again. **Uncompressed size: 299K**

CALENDAR V1: Do lots of silly and, yes, completely useless things with dates. **Uncompressed size: 250K**

WORDFIND: The wordsearch game that works on all STs, blitter or otherwise. High resolution, or use *Sebra* (see below). **Uncompressed size: 59K**

ST DISK CAT 5.2B: Read your disks and catalogue them automatically with this essential utility. **Uncompressed size: 182K**

ANIMATE 4: Load up your images and play animated sequences. With two example files. **Uncompressed size: 154K**

SEBRA V1.33: You'll need this to run *Wordfind* if you only have a colour monitor or TV. **Uncompressed Size: 24K**

DISK KIT: A Desk Accessory created for the Cover Disk by the inimitable Clive Parker. Manipulate your disks like never before. **Uncompressed size: 26K**

MENU: Even your granny could use this program, in between eating all the mince pies this Christmas. Then load up *Stardust* and watch her go! **Size: 10K**

BACKUP: Prevent tears this Yuletide by making sure your Cover Disk is securely backed up before use. **Size: 13K**

Your guarantee of value

This magazine comes from Future Publishing, a company founded just nine years ago but now selling more computer magazines than any other publisher in Britain. We offer:

BETTER ADVICE: Our titles are packed with tips, suggestions and explanatory features, written by the very best in the business.

STRONGER REVIEWS: We have a cast-iron policy of editorial independence and our reviews give clear recommendations.

CLEANER DESIGN: You need solid information fast. So our designers highlight key elements by using charts, diagrams, summary boxes, annotated photographs, and so on...

GREATER RELEVANCE

At Future, Editors operate under two golden rules: ■ Understand your readers' needs ■ Satisfy them ■ "Oh no he didn't." "Oh yes he did."

MORE READER INTERACTION: We draw on readers' contributions, resulting in the liveliest letters pages and the best reader tips. Buying one of our magazines is like joining a nationwide user group. More pages, more intelligent staff, better quality - magazines you can trust.

COVER DISK

GET STARTED WITH THE ST FORMAT MENU PROGRAM

ST Format Program Extraction Utility - Written by Andrew Software

1 ST Format Cover Disk 66
Select the program you wish to copy, press **Enter** and follow the instructions on screen. Make sure you have blank formatted disks ready. Press the **ESC** key to exit.

2 **File Selector** (Screenshot)
Default: the short-form star on your 20MHz ST!
Please select the file:
Press any key.

3 **File Selector** (Screenshot)
Directory: B:\A.
Selection:
Please insert disk B into drive B.
Press any key.

1 Put the Cover Disk in drive A, and double-click on the STF 66.PRG icon.

Once the ST FORMAT logo appears, press any key and you're faced with an Options screen not unlike this one.

ST Format Program Extraction Utility - Written by Andrew Software

2 **File Selector** (Screenshot)
Directory: B:\A.
Selection:
Please insert disk B into drive B.
Press any key.

2 Once you've made your selection, you're faced with your file selector. Select drive B (TOS 1.02 owners should click on A:) and replace it by typing **B:** before clicking on the Close Box icon).

ST Format Program Extraction Utility - Written by Andrew Software

3 **File Selector** (Screenshot)
Directory: B:\A.
Selection:
Please insert disk B into drive B.
Press any key.

3 If you have a single drive you'll be asked to insert disk B (your blank disk) into Drive A. Do so, and once your file selector displays the information concerning Drive B, click on OK to proceed.

ENDURANCE

BY: Ozzy Omara

MACHINES: All STs (Falcon-compatible via *Backwards*)

MEMORY NEEDED: 512K

RESOLUTION: Low

UNCOMPRESSED SIZE: 319K

GET STARTED: Double-click on BRIEF for all the details you need. It's auto-booting so don't try to run *Endurance* from the Desktop after decompressing

Endurance scored a massive 90% when it was reviewed back in issue 57. It's one of those virtual

reality adventures, is written using Domark's *3D Construction Kit* and runs incredibly smoothly. It'll work on all STs, but has the added bonus of running faster on machines with more RAM, as well as the STE or Falcon. Falcon owners will need a copy of *Backwards* to run *Endurance*, which is available from all good PD libraries.

The aim of the game is simple: it's 2500AD and you're up for promotion. Sounds rather spiffing doesn't it? Unfortunately, the motto for the Galactic Federation is 'make

the grade or die'. Your task in *Endurance* doesn't involve saving the universe or anything mundane like that. Oh no, there's a new Hyperspace Route going through your sector and unfortunately a few planets and moons have got in the way, including one that has been assigned to you for destruction. You must first find and disarm the Harpey Detonator, then deactivate the missiles from the planet's surface. Once done all you then need to do is get off the planet before it explodes and be home for tea time, or else there'll be hell to pay from your mum.

What does what?

You'd be forgiven for finding *Endurance* a little daunting at first. Have no fear! Here's the definitive ST FORMAT guide to what those icons mean and do. When rummaging through your rucksack looking for an object, use the movement controls to poke around inside before clicking on its associated triangle to highlight it ready for action.

Claustrophobic?

You start the game trapped inside what must be your quarters on the orbiting space station. First priority: get out of the room. You interact with your environment using the mouse and icons, which are displayed at the top and bottom of the

Moving around *Endurance*

- | | | |
|-------------------------------------|---|--------------------------------------|
| 1 Rotate your position left | 6 Rise | 11 Look downwards |
| 2 Move ahead | 7 Rotate your view anticlockwise | 12 Turn around 180 degrees |
| 3 Rotate your position right | 8 Sidestep left | 13 Drop |
| 4 Look upwards | 9 Move back | 14 Rotate your view clockwise |
| 5 Look ahead | 10 Sidestep right | |

ST Format Program Extraction Utility - Written by Netras Software

Inject the short-menu star on your 3MByte ST!
Please select the DESTINATION for this program.
Press any key.

4

Once you've clicked on OK, you'll be faced with another dialog box telling you to insert disk A (your Cover Disk) into the disk drive. Do so before clicking on OK to start transferring the program.

ST Format Program Extraction Utility - Written by Netras Software

Inject the short-menu star on your 3MByte ST!
Please select the DESTINATION for this program.
Press any key.

Press any key.
Loading: 4396.128
Copying: 4396.128
This file is packed.

5

The relevant files will be loaded into memory before you're told to insert disk B (your blank disk) into the disk drive. Do so, and click on OK to start saving the files to your blank disk.

Self extracting ZIP archive 3319 by Stefan Gross

Extracted: 3
Extracted: 3M

Press any key/the program specified has been transferred across.
Press any key.

6

If the file is compressed, you will be told that the files are unpacking (see above). Once done, you will be told of the successful file transfer and you are returned to the Menu screen. Press <Esc> to quit.

Don't forget

Write-protect your Cover Disk. Slide the black tab so you can see through the hole.

Make a backup using the Backup program on the Disk. NEVER ever run software directly from the Cover Disk except Backup.

Many Cover Disk programs are compressed to fit them on the Disk. Use the Menu program to copy and extract them to your blank disks. Step-by-step instructions are given just to the left.

Read the instructions in these pages and in any document file that is on the disk. They're there for a reason.

If you have any general problems with your ST, consult your manual. If you are still stuck then write in to ST Answers, 30 Monmouth Street, Bath, BA1 2BW.

Interacting with the Endurance world

- 1 Read or validate
- 2 Take objects for rucksack, take and eat food
- 3 Open doors, move or activate objects
- 4 Rucksack icon for using objects.
- 5 Ammo icon (for when you find the ammo)
- 6 Resets game (also <Esc>)
- 7 Switches Crosshairs on or off
- 8 Tells you how long you have left
- 9 Monitor: works with Eye icon

- 10 Your 3D view of Endurance.
- 11 Save file
- 12 Load file
- 13 Personnel icon: monitor health status and mapping

screen (see the panels above and to the left for more details). When you wish to pick up, move or just find out about an object, click on it with the right mouse button to achieve the desired effect. To succeed you're going to have to search the base extensively to solve all the puzzles before time runs out and you die. It's shareware, so if you like it you know the brief.

STARDUST

BY: Bloodhouse/Daze
MACHINES: STEs and Falcons
MEMORY NEEDED: 1MByte
RESOLUTION: Low
SIZE: 228K
GET STARTED: Double-click on TUNNEL.PRG

Ye gods! If Stardust is proof of what the STE is graphically capable

of then someone should be taking software producers to court for criminally ignoring its talents. In this exclusive demo you get to play the tunnel sequence, one of the subgames from Stardust itself. Your fighter craft, bearing slightly more than a passing resemblance to a well-known ship from the Star Wars series, hurtles down a tunnel at incredible speeds, while aiming to avoid or destroy the various

■ If you like the idea of hurtling at massive speed towards almost certain death then Stardust is for you...

polygon-shaped hazards that are bearing down on you.

It's not that easy, but because you have infinite lives you can marvel at all the explosions (largely the result of your spacecraft blowing up) and speed of it all. The graphics are arcade-quality and make a mockery of those who no longer see the STE as a serious games platform. So if you have an STE or Falcon you can laugh hysterically while you weave your joystick erratically, without consideration for your fellow man, reducing everything around you (including yourself) to atoms. Stardust costs £24.99, so if you like what you see call Daze on 0171 372 7435. Alternatively wait for the definitive STF review when the game gets its full release next month.

■ ...if you don't however, perhaps a nice cup of tea and early night would be more suited to your fragile disposition.

■ The first thing you need to do in Endurance is get out of your cabin. Here's a tip: think of the tooth fairy.

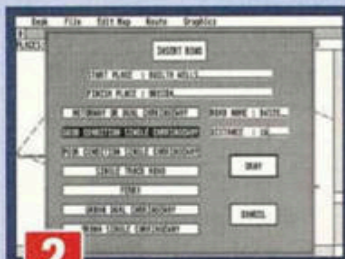

LOCAL TALK

One of *Route Finder's* features enables you to improve the detail in areas of the map that you're particularly interested in. Wales, for example. Here's how to go about it.

1 Zoom into the part of the country where you wish to make your changes. To do this, you just hold down the left mouse button while dragging the mouse over the area that you're going to amend. You'll have to do this a couple of times to get to the desired magnification, but when you do you should see something rather like that shown here.

2 If you're inserting a place on a road between two others, you must remove the road between the two places first (press <F2>). Then click on the map where you want your new place to go. Once all its details have been entered you can then link it up to the other two places by inserting the details about the roads that connect it to other local places.

3 It's a fiddly process, so make sure you save it regularly (select 'Save' or 'Save as' from the File menu). Keep inserting places and roads as demonstrated in the second column and you'll soon have a network of roads like the one shown above. This is only half complete, but you can already see how detailed your map can look with a few additions.

ROUTE FINDER 2.0

BY: Brian Henderson
MACHINES: All STs, TTs, Falcons
MEMORY NEEDED: 1MByte
RESOLUTION: Medium/High
UNCOMPRESSED SIZE: 320K
GET STARTED: Double-click on FINDER20.PRG.

Scoring an impressive 86% in the PD section this month is *Route Finder 2.0*. If you're after a program that enables you to plan your road journeys in advance then this is the one for you.

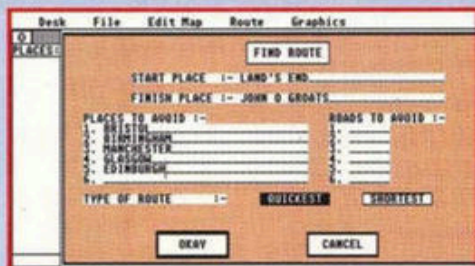

Just enter the name of the places you're travelling between, select any roads or towns you'd rather avoid, and the program calculates the shortest or quickest route you can take, depending on your preference. It displays it as text or in the form of a graphical map highlighting the route you're to take. If the database doesn't include your obscure village you can even enter new places and roads with the minimum of fuss - see the walkthrough above.

Wales... and sheep

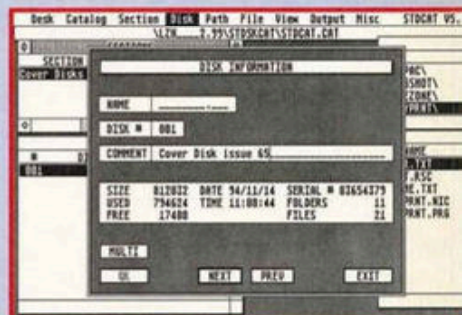

And just what is the advantage of being able to add your own

obscure villages? Take this example: the only way to get to Llanwrtyd Wells according to *Route Finder* is via Sennybridge and Llan-doverly, a distance of 31 miles. With the additions highlighted below you can get there in 25 miles. You've also tailored the programs to your individual local needs. Now all you need to do is spend a few sleepless weeks inserting every single milestone from your road atlas into the program and you've won the 'Sad Fool of 1994' Award, pipping Nick to the coveted title at the very death.

Registering costs just £10, and is well worth the expense. You will find the shareware restrictions (the highly annoying 15 second delay and limit of 200 miles on routes) lifted, plus you receive version 2.1 which has many new features, including a better defined graphical map, with the ability to zoom in and out of it to your heart's content. If you're particularly keen on zooming in and out of maps, that is.

Unfortunately you can't find routes of anything greater than 200 miles in the shareware version of *Route Finder*, but if you register, however...

Keeping tabs on what's on which *Cover Disk* is easier than it's ever been now that you've got *ST Disk Cat 5.2b* to handle it all for you. Super.

Personal Pascal troubles?

Two months ago, on *Cover Disk 64b* to be precise, we gave away *Personal Pascal*. Now if you've been following our tutorial series, you may have experienced problems with the PASTLIB file, which prevent you from compiling programs. To avoid this you need to format your *Personal Pascal* disk to 80 sectors and 10 tracks, because a normal 720K disk is not always big enough to decompact the files on to. You can use *DosAcc* from *Cover Disk 64a* to format your disk to the required size (select Extended Format) - that should solve the problem. Or, even easier, use *Disk Kit* (next page). Clever, eh?

ANIMATE 4

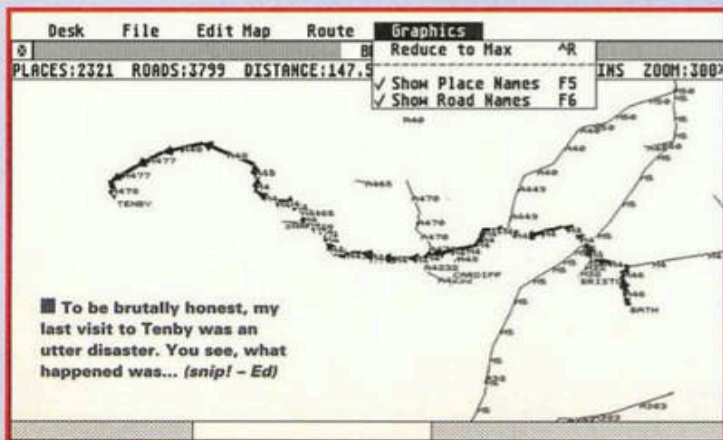

BY: Tom Hudson
MACHINES: All STs
MEMORY NEEDED: 512K
RESOLUTION: Low/Medium
UNCOMPRESSED SIZE: 154K
GET STARTED: Once decompact, double-click on ANIMATE.PRG to run the program, then click on the .SEQ button when you reach the file selector to access the two sample files, BUZZBEE.SEQ and CUBE1.SEQ

Animate 4 is a file sequence player that enables you to play SEQ and DI? files created using the *Cyber* family of programs (such as *Cyber Studio*, *Cyber Control* and *Cyber Paint*). Once you've got the program up and running, read our

This, believe it or not, is a bee, and it's on this month's *Cover Disk*. So try not to get stung, okay?

enormous animation feature beginning on page 14 before deciding that in fact you can do better. And if you can, why not send in your efforts to the *Cover Disk* address? You never know, we might just bung it on a future *Disk!*

WORDFIND

BY: Derek Johnston
MACHINES: All STs
MEMORY NEEDED: 512K
RESOLUTION: High
UNCOMPRESSED SIZE: 59K
GET STARTED: Once you've dearchived *Sebra* and *Wordfind* to your blank disk using *Menu*, re-boot your ST and double-click on *WORDFIND.PRG* (in the *WORDFIND* folder)

At last! A wordsearch program that runs on all STs, regardless of blitters or memory. Because it only runs in high resolution we've included *Sebra*, the monochrome emulator, to enable you to run it even if you have a colour display.

It's easy to use - just enter your words and the size of the grid and the program randomly places them for you. Then enter a string of text to fill up the other spaces and, before you know it, you have your own wordsearch. You can print it or solve it on screen - click on the letters of each word as it is highlighted to eliminate all the words until the puzzle is complete.

It's the kind of program that'll appeal to all the family. If you like it and fancy the possibility of a colour version - why don't you just go ahead and register for the measly sum of £5? Read *WORDFIND.DOC* for full details and instructions.

■ You'll be glad to know that this particular wordsearch is not featured on the Disk. Someone sedate this person.

DISK KIT

BY: Clive Parker
MACHINES: All STs
MEMORY NEEDED: 512K
RESOLUTION: Any
UNCOMPRESSED SIZE: 26K
GET STARTED: Select the program from *Menu* and it's dearchived on to the root directory of your blank disk. Re-boot with the disk in your drive and *Disk Kit* is installed. Now call it up from the 'Desk' menu whenever you need it

Exploring the dark past of the man known only as Clive Parker, we came across this little GEM of a Desk Accessory. While Clive recovers in hospital, you can call it up from within any GEM program and use it to format disks, call up the file selector, rename and delete files, and create folders. When formatting a disk, you can not only make it single or double-sided (like the standard 'Format' option from the Desktop), but format it to more than 80 tracks and nine sectors, enabling you to store more data on your disks. Thanks Clive.

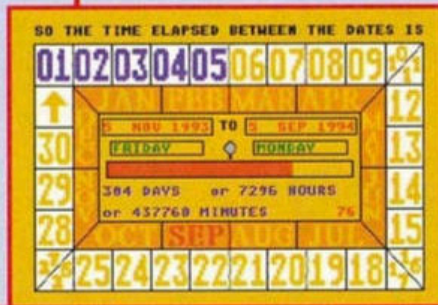

CALENDAR V1

BY: Andy Gray
MACHINES: All STs
MEMORY NEEDED: 512K (1MByte recommended)
RESOLUTION: Low
UNCOMPRESSED SIZE: 250K
GET STARTED: Double-click on *CALDAR1.PRG*.

This represents what Crimble presents are about - fun with just a smidgeon of practical use. It gives you information about dates - from what day of the week you were born through to how many shopping days are left until Easter. All you need to do is enter two dates - day, month and year - and the program not only tells you on which day both occurred, but also the elapsed time between the two dates, in days, hours and minutes.

For example, did you know that our Disk editor will be 8,060 days old on Christmas Day this year, which is 193,440 hours, or 11,606,400 minutes? Our wonderful production editor (*what me? - Jill*) was born on a Tuesday, while it's been a hard 1,065 days since Freddie Mercury left this planet for something even greater than the majesty of Queen.

■ It's colourful, it's cheerful, and you can use it to calculate things like the length of failed relationships.

So go on, bore your granny with countless facts based on dates, giving her the excuse to go on about the war years until she's red in the face. Then send £5 to the author (see the *CALENDAR.TXT*). Okay?

Problems?

If you can't load, copy or back up your Cover Disk then you may have a faulty disk. Send the disk and a padded self-addressed envelope to: **ST FORMAT December Disk Returns, PO Box 21, Daventry, NN1 5BU.** We pay the return postage for you.

PLEASE DON'T send faulty disks to our Bath or Somerton offices. We don't keep stocks of Cover Disks.

If you are having problems with a Cover Disk program, reread the instructions and any DOC files. If you still have problems, call the **ST FORMAT Cover Disk Hotline on 01225 442244 on Wednesdays between 2pm and 6pm only.**

Cover Disks are double-sided. If you have an old STFM and can't read the Cover Disk then you need to upgrade your ST to a double-sided drive.

If you have other hardware or software queries, contact the manufacturer or publisher. Or ring the official Atari Helpline on 0131 332 93233 between 6pm and 11pm Monday to Saturday and 8pm and 11pm on Sundays.

SEBRA V1.33

BY: Patrik Persson
MACHINES: All STs
MEMORY NEEDED: 512K
RESOLUTION: Low/Medium
UNCOMPRESSED SIZE: 24K
GET STARTED: *Menu* dearchives this into an Auto folder on your blank disk. Re-boot with the disk in Drive A, then install *Sebra* by merely pressing a key

Sebra enables you to run monochrome-only programs on a colour display. And, surprise surprise, this month's Cover Disk *Wordfind* runs in high resolution only, so if you don't have a monochrome monitor, you can still play the game using this. What are you waiting for then? Get wordsearching (or something)!

BACKUP

BY: Brian Tilley
MACHINES: All STs
MEMORY NEEDED: 512K
RESOLUTION: Any
SIZE: 13K
GET STARTED: just opening up the *BACKUP* folder and double-click on *CD_BACK.TOS*

Why bother? Well, it can save you grief in the long run. You need a secure copy of the Cover Disk as

an insurance policy if something goes wrong with your working copy. It can save you time and hassle having to return your messed up disks for replacement, and it gives us more time to work on bringing you the best ST magazine in the world. Of course, if your little darling (aged 37.5) opens his stocking and goes on to corrupt his Cover Disk before getting a chance to use any of it he's not going to be too happy, is he? And that could wreck 1995 for everyone. **stf**

WE WANT YOUR PROGRAMS

We pay for your software - so if you have anything that's good, original and preferably short that you think really deserves to go on *ST FORMAT*'s Cover Disk, send it with this form and full documentation to Nick Peers, *ST FORMAT*, Cover Disk, 30 Monmouth Street, Bath, Avon BA1 2BW

Name _____
 Address _____

 Daytime phone _____ Program title _____
 _____ Total size in K _____

On a separate sheet, explain concisely what the program does and why you happen to think it's so brilliant.

Remember to: ■ Include on-disk and paper documentation ■ Write your name and address on the disk ■ Use a virus-free disk ■ Keep a copy of your program, because contributions are non-returnable ■ Enclose an attractive bribe. A Queen CD perhaps ■ Not that it makes a difference
 Please sign the following declaration: This program is submitted for publication in *ST FORMAT*. It is wholly my own work and I hereby agree to indemnify Future Publishing against any legal action should copyright problems arise.

Merry Christmas from HiSoft

Silsoe Village Scene by Gordon Chambers, typeset by Leaside Graphics, Luton.

It's that time of year again, frosty mornings, roaring log fires, red noses ... and all those presents to buy.

We know how difficult Christmas buying decisions can be so, to make life just a little easier, we've come up with some splendid gifts for the Atari lover in your household, at bargain prices.

From programming languages to real-time video digitisers, we have something that should appeal to any discerning Atari enthusiast who wants to get the most from his Atari computer during the festive season.

To take advantage of these bargain buys just call us on 01525 718181, armed with your credit/debit card details, or write to us enclosing a cheque or postal order. Please add £3 P&P to each order for delivery within the UK. We will despatch goods within 5 working days or, for an extra £6 postage, the same day on a 24 hour delivery, right up to Christmas. Please quote reference ATX948 when ordering.

PD WHILE YOU WAIT

BY SIMON FORRESTER

Datasoft PD have teamed up with the Aim Computers store in Edinburgh to bring you Britain's first in-store PD library. You'll now be able to view and test PD, and get a proper idea of exactly what you're ordering before you take it away with you. Historically, ordering PD software has always been a problem. Although most libraries are honest, clean and efficient, things always go wrong. You have to rely on the postal system, you have to trudge through disks full of tat to find the program you want, that sort of thing. But no more...

No more ordering. No more waiting. No more mistakes, delays, corrupted disks, padding, postal

charges, disappointment and no more secretly naff titles. Just a long trip to Edinburgh (unless you

live there). Having said that, you can still order titles by mail – ring ☎ 0131 553 7997 for more details.

MAKING MUSIC

YAMAHA, MANUFACTURERS OF top-quality music equipment for, well, the planet really, have just announced the launch of the CBX-D5, a hard disk recorder compatible with most machines, although it's aimed largely at the Atari range.

The CBX works in the same way as a four-track recorder, and Yamaha claim that it offers CD-quality reproduction with a few extras. Using the CBX, you'll be able to mix your tracks quickly and easily, applying effects like reverb, delay and distortion without the data ever leaving the box.

Yamaha are particularly pleased with the CBX-D5 for lots of reasons. Unlike most other hard-disk recorders, the CBX is entirely stand-alone, simply using the ST for control purposes. The technical bits that do the hard work come with the CBX, taking the strain off the computer. Apart from increasing the CBX's performance, this also means that you can run it from just about any ST without any noticeable setbacks – an STFM user would get the same powerful results as a Falcon user.

Effectively, you'll be able to combine this little box with your ST

and come up with a complete recording studio. You can do away with things like patch-leads, booths, desks because now your ST will be able to do it all.

Only that's a bit of a fib, really. Your ST still won't be able to walk to each mike in turn and monotonously state "1...2...testing...1..." into each just like they do at those 'gig' things. And at £1,599 the CBX ain't cheap.

But if you're seriously into your music and want more info on this new hard disk recorder then, give Yamaha a ring on ☎ 01908 366700. And they should be able to sort you out.

☐ Trenton got all excited when he saw the Yamaha envelope. He thought it his chance to review a VMax, but it was all about the CBX and he's a worse musician than he is rider.

FALCON PINBALL

STOP PRESS: 16/32 Systems have released *Pinball Dreams* for the Falcon030. This computer pinball classic costs £24 and is available NOW! They've also secured the much delayed release of the *Llamazap*, again for £24 (or £40 with a Jaguar controller). The Falcon specific games *Steel Talons* and *Evolution Dino Dudes* are also available. For more details of these and 16/32's plans for 12 Falcon only games contact 16/32 on ☎ 01634 710788 or e-mail on nharlow@cix. More news next month.

THE NEWS

VOICES IN MY HEAD

WE RECENTLY RECEIVED A COPY of *Voices*, a new and incredibly strange disk magazine aimed at absolutely anybody with a computer. Well, it's ST, PC, Amiga and Mac compatible, which just about covers everyone.

Dave Cobbledick, editor of this strange little tome, made the conscious decision to aim this away from the ST-only market. As he explains, "Whatever computer you own and whatever tasks you ask it to perform, if it gets you from A to B satisfactorily and the results given are what you desire then there is little more you can ask of it." Quite right too. Aiming a diskzine at the entire computing spectrum does suggest problems, which is why the disk is MS-DOS format – if you can read PC disks (and you can with an ST), you can read *Voices*. To make things even easier for you, a text-file viewer is supplied. Not that it's necessary but it's the thought that counts.

What makes *Voices* so abnormal, in case you were wondering, (hadn't occurred to me, actually – Trent) is that it really is a collection of voices – opinions, articles, monologues, ideas, anything really. It includes articles on everything from artificial intelligence to UFOs, which makes it worth reading for novelty value alone. Working in the world of computers, you see a lot of odd things, but this one really takes the biscuit. Dave's trawled through the Internet for the oddest imaginable concepts, and next month you get to add your own comments. You can get a copy from the Dunces Cap Software address listed above. It's worth a look for entertainment alone.

PENGUIN + AXE = ...

PENGUIN HAVE RELEASED A book by Steven Levy called *Hackers*, which should quickly re-install the panic of data security

terror across the nation – cue scare stories on the Beeb about hackers and the Internet. The book chronicles the activities of all those who've earned a place in hacker history, from hackers to phreakers and just about everyone in between.

Costing £6.99, *Hackers – Heroes Of The Computer Revolution* is available as you read this from all good bookshops (ISBN 0-14-023269-9). Seven quid is a good price to pay to adopt some new heroes, armed with only keyboards and pocket-protectors.

■ **Hackers or heroes?**
The revenge of the nerd or the final recognition of computing as a legitimate hobby?

SNIPPETS

REPORTS OF THE DEATH OF Warpzone PDL have been greatly exaggerated – they do still exist and are still trading.

In our PD library survey (which appeared in *ST FORMAT* 64) their lack of response earned them a place in our In Memoriam panel, which wasn't right. They are still in business and can be contacted at: 53 Ropewalk, River Street, St Judes, Bristol, BS2 9EG or by phone on ☎ 0177 9412 021. Sorry about any confusion.

JAGUAR PRICES HAVE BEEN slashed at Silica shops to a mere £200! The new price of £199 marks a £30 saving from the official RRP and is achievable because of a flukey favourable movement in the Dollar/Pound exchange rate.

This price cut neatly parallels an surge in Jag sales: *Alien Vs Predator* and *Wolfenstein 3D* sold out within days. Silica have also launched a 12-page, 30-game Jaguar software catalogue. It's free and is available at any Silica

branch or can be obtained by phoning ☎ 0181 3091111 and telling them who you are.

ALL DAVE COBBLEDICK BACK catalogue software, which was previously available through most PD libraries, will now only be available from Merlín, Floppyshop, Goodman, LAPD and MT PDL (see page 71 for contact details). The software, four compilation disks, is also set to become licencedware.

This move has been prompted by pitiful registration rates from the titles as shareware. All new Cobbledick releases will also be available as full commercial programs direct from Duncie's Cap Software at: 245 Rosalind, Street, Ashington, Northumberland NE63 9AZ. For more details on the shareware crisis see our Share and Enjoy feature, which starts on page 74 and for more details on Dave Cobbledick's games stay tuned for our rather splendid interview with the man next issue. **stf**

NEXT MONTH!

SKILL!

Your ST is just the beginning. A powerful, flexible tool, it isn't just a number crunching games machine but can help you with everything from conversational Portuguese to passing your driving test. Find out what your ST can do for you in full next month! It could change your life (maybe).

OBSESSION

Not the poncey Calvin Klein aftershave but the gobsmackingly brilliant new pinball game from Unique Developments. *Starball* is the current kingpin but will the big O knock it from the top of the high-score table?

IT'S A LOTTERY

With National Lottery software on the Cover Disk *ST FORMAT* asks: "What would you do with £5million?" Dug Armstrong

dreams of what you could do with a 14MByte Falcon and a wagonload of cash. It could after all be you!

DATA DAY

It's a battle royale between *Superbase Pro* and *Twist 2*. Which crunches numbers better? Which is quicker? Which is friendlier? Which offers the most features? If you want to know, you want to be reading *ST FORMAT*.

**FEBRUARY ISSUE ON SALE
TUESDAY 10 JANUARY
1995!**

ANIMATE!

Animation is not only possible on your ST, it's great fun and surprisingly easy. ST FORMAT shows you how to bring your pictures to life. Read on and you'll find 13 pages of essential animation information to get your ST moving.

Licensed by: Determined Productions, Inc. NY

The *Lion King*, *Deep Space Nine* and *Forrest Gump*. Without computer animation none of them would have been possible. The digital revolution has given animators the power to create scenes beyond the wildest dreams of *Mortimer Mouse* or *Felix the Cat*. Whatever you want to animate it's going to be easier with a computer. With the right software, a little hard work and some imagination you can turn your ST into a studio for the creation of all manner of animated antics (sorry). You'll be amazed how easy it is.

Back in the bad old days you had to be able to draw if you wanted to become an animator. You had to be able to get your head around things like cels and inking. But that has all changed. Although you can still draw your way to animated greatness, drawing talent is not essential. You no longer have to deal with tedious pen and ink nonsense – and you don't need to be able to draw at all. Your ST can pull in images from a range of sources, or even calculate them from polygon points for you.

Animations create the illusion of smooth movement by

displaying a series of still frames at high speed – at least 12.5 frames per second – so that the eye is unable to distinguish an individual frame. The traditional method is for the artist to hand craft each cel, then photograph and store it, for display when the whole sequence is completed – a slow, expensive and tedious process. But computers are good at tedious tasks. They can help you with the drawing process, store large amounts of data and display it all when complete. Computers and animations were made for each other.

The first attempts at computer animation involved massive, expensive machines

(the fabled Cray super computers), and the results, while impressive, were still out of the reach of the would-be home animator. To craft just a few minutes of films like *The Last Starfighter* and *Tron* took months of rendering and modelling. But computer power and programming skills have pushed back the boundaries. Nowadays we accept films like *Forrest Gump*, *The Lion King* and *Star Trek VII* without batting an eyelid. We take breathtaking quality for granted.

It's an art

We've split computer animation into three different camps: cartoons, models and video manipulation. The first two follow and develop traditional animated paths, while the third is a new development made possible by digital media.

Using your ST to create cartoon-style 2D animation enables you to switch palettes, try out ideas with the safety net of an Undo function, save backgrounds, and scan or paste pictures from other documents. As well as saving time computers also give

ATE!

© Disney

2D cartoon animators greater scope and power. Computers made the stampede scene in *The Lion King* possible, for example – the use of Cut and Paste techniques saved the artists having to draw every wildebeest by hand*.

3D animated models were once the domain of *King Kong*, Ray Harryhausen's *Sinbad* and Gerry Anderson's *Thunderbirds*, all of which used real models that were sculpted and posed one frame at a time. But thanks to the miracle of 3D modelling technology entire scenes can now be modelled to look perfectly lifelike, using techniques like rendering. Once modelled the world can then be moved and viewed from any camera angle or perspective. Shots can be tried time and time again, without having to commit to film. In *Deep Space Nine*, for example, computer models replaced the more traditional 'Air-fix' approach.

The digital domain has also introduced an entirely new element to animation. Computer animators can capture video

images and mould them any way they like. *Zelig* and *Forrest Gump* used the technique to insert actors into classic newsreel footage. *Terminator 2* used it to retouch the 'real' models in the nuclear war scene. And it also gave us morphing, an effect that initially stunned the world but is now commonplace. And if you haven't seen *The Mask* or *Terminator 2* you should really stop reading now and go and get yourself a dose of 1990s culture. Right now. Immediately.

Let's get started!

You can join in the animation revolution. Using your ST you can create surprising results and we're here to show you how. Over the next ten pages the worlds of cartoon, 3D and video animation are explained, with examples and walkthroughs. It doesn't even matter if you can't draw!

Lights. Camera. Action!

*I know there was more to it than that, Mr Disney, it was a broad-brush example.

MOVE IT!

2D Cartoons page 16

Find out how to make brilliant 2D cartoon animations on your ST. The best ways to make your 'toons walk, talk and smalk (?). Simon Forrester tells you all you need to know to start making your own cartoons.

3D models page 20

Sculpt your own world, raytrace it, and bring it to life. Ed Ricketts shows you how to get started in the world of model animations. The software, the system requirements, the file formats, the lot...

Video manipulation page 24

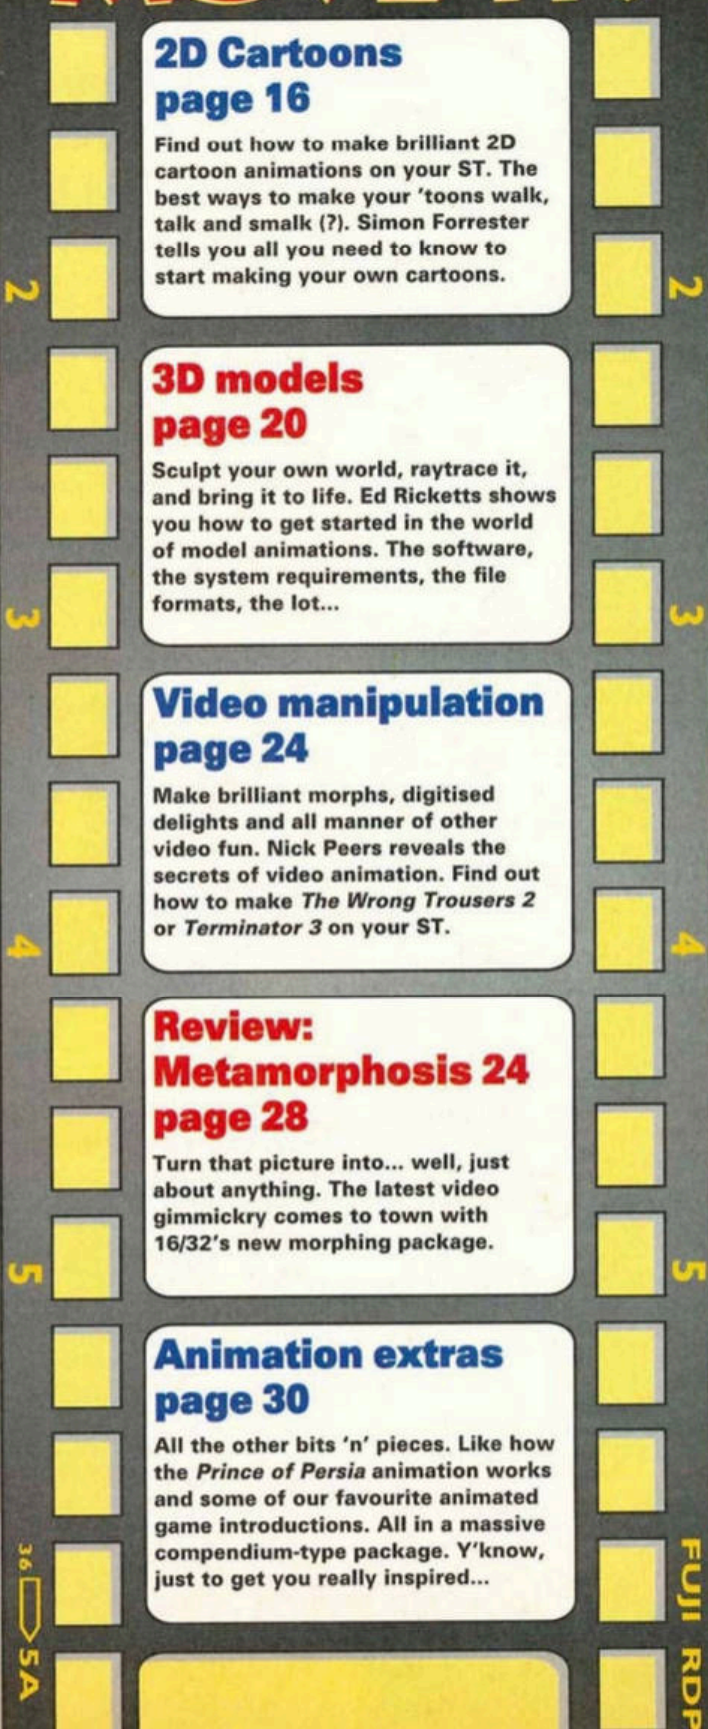

Make brilliant morphs, digitised delights and all manner of other video fun. Nick Peers reveals the secrets of video animation. Find out how to make *The Wrong Trousers 2* or *Terminator 3* on your ST.

Review: Metamorphosis 24 page 28

Turn that picture into... well, just about anything. The latest video gimmickry comes to town with 16/32's new morphing package.

Animation extras page 30

All the other bits 'n' pieces. Like how the *Prince of Persia* animation works and some of our favourite animated game introductions. All in a massive compendium-type package. Y'know, just to get you really inspired...

Cartoon

ANIMATION

Simon Forrester shows you how to create your own indestructible little cartoon characters. Then is crushed by a falling safe.

Before you get into the complicated processes of things like 3D modelling, rotoscoping, digitising and fast data, you need to understand what animation is, and how to use it fully. The obvious place to start is the most widely known type of animation – cartoons.

By cartoon, we mean anything that gives the illusion of movement using a series of drawn frames, from the latest *Tiny Toon* adventures (top Babs action), through *Felix the Cat*,

right back to *Steamboat Willie* (dross that it was). These are all typical cartoons – a series of hand-drawn frames displayed in quick succession.

You can also find cartoon animations in computer games. For example, *The Secret of Monkey Island* was basically one huge cartoon – complete with loads of classic daft gags – and featured animated asides as well as the core cartoon game.

Forget brains. Forget beauty. Thumbs rule

As with all things computery, the clever techniques you see on screen are based on earlier, stone-age methods. For example, let's take a look at one of the earliest forms of cartoon: the flickbook.

Everybody's made a flickbook – they're easy. Just take a small piece of paper and draw a simple picture on it, a stick man perhaps. Take another piece of paper and draw the same picture again, making minor

changes. Keep adding pages until you have around 20 frames, staple the pieces together to make a little book. Hold it by the staple and flick through the pages quickly with your other hand, and you'll see your animation working. As each new and slightly different frame flicks past the eye in quick succession, the pictures merge to form fairly smooth movement.

Enter the computer

But how does creating flickbooks from paper and ink help you create animations using your ST? Well, animation on computer is exactly the same as animation on paper, but easier. Given the right software your ST can store the frames either as separate images or as a series of frames, enable you to make minor changes to each image with ease, and when your

It's a tradition. Whenever we cover *DPaint*, the gorilla gets coverage.

ANIMATING WITH DELUXE PAINT, IN A FEW SIMPLE STEPS

1 First off, draw a stick bloke. You're going to animate his left arm, so don't bother drawing that part yet. After all, you don't want to have to rub it out on every subsequent frame (this picture will be copied, you see).

2 Call up the animation panel. To create frames, click the Add button, until you have ten. Move between frames using the arrows in the box, but first, click the Copy to All button to copy your bloke to the other frames.

3 Still on frame one, draw in little blokey's arm at its starting position, which in this example is down by his little stick body. You could animate more than just an arm, but we won't bother for now – keep things simple 'n' that.

ATE!

AN EYE FOR DETAIL

Creating smooth-looking animations involves tricking the human eye. Human eyes have what we call persistence of vision. Any image you see remains imprinted on the retina for a fraction of a second, until another image replaces it. Close your eyes and you can briefly see light shadows of what you were looking at beforehand.

Cartoon animations use this by leaving one image on the retina and displaying another on screen, so the eye doesn't see a flick so much as the gradual fade from the first image to the

second as it dies on the retina, replaced by the new picture. This means that you can rely on the eye to smooth out the flickers and the mind to fill in the gaps. But how big can those gaps be? Well, as a general rule, you should try to get as many frames of animation into one second as you can. More than 25 and you're just being silly, but anything under five or ten will be too slow and flickery. Disney hover at around 13 frames per second, and if it's good enough for *Snow White*, it's good enough for us.

series of images is complete you can animate them – display them in quick succession.

But what's the right software? There's a round-up of art packages over the page, but a good place to start is with *Deluxe Paint*, which is available from EA (☎ 01753 549442) for £59.99. Not only is it a powerful all-round art package, but it has a specialised animation feature to make your life easier.

There's a control panel, represented by a cine camera, that enables you to edit not just a single screen, but also a series of frames, on which you can draw your gradually changing images. You can then use the same feature to display these frames in fast succession, performing the computerised equivalent of a flick through your computerised images. Follow the walkthrough over the page.

CREATING YOUR OWN ANIMATIONS

1. Your pictures

You will, of course, need to draw your original images. You can either draw them frame by frame in your chosen art package, or, using *DPaint*, draw one frame and copy it to the others, changing things as you go. There are a couple of other ways to get hold of good illustrations to work with. If you have a scanner you can draw the original

■ Iiiit's a hand scanner. It fits in your hand, and it scans. A hand scanner.

© Disney

■ A grab from *Rugby League Manager*. Now you've seen this before, but imagine if you had a Ripper cartridge. The possibilities for those arms are just endless.

frames on paper or even create non-glued montages, à la *Monty Python*. Or you could use a Ripper cart to rip sprites out of games – and there are always plenty of graphics to work with in any game. Just hand over £15 to Power Computing ☎ 01234 273000 and you can rip graphics out of just about any piece of software you own (see above picture). But a little stick bloke will do to start with, while you get the hang of the techniques of animation.

2. Order

Of course, you have to worry about the order your pictures come in, and how they all fall together. Obviously you have to make sure they're all in correct sequence. You should also make sure each picture isn't too different from another. Nothing should vanish or appear or change drastically from frame to frame; things should simply move. If you have a background on one frame, you'll need a background on all the others. If you have a ball

4 Advancing to the next frame (see step 2), add an arm to the second bloke, this time in a slightly higher position. Make sure the change isn't too large, though, or you'll create a flickery, unwatchable animation.

5 Keep adding the arm to each of the frames, changing position each time until eventually, on the last frame, he's full into the two-fingered gesture. You could have a more polite stick man, but that'd be no fun.

6 Go to the animation control panel and click Play. Change the frame rate using the control provided, as well as whether the animation runs once, loops, or bounces from one to ten and back, continuing until you stop it.

bouncing across the screen, for example, the ball must feature in several frames and move approximately one ball's width (or half, even) each frame. It can't just disappear suddenly, and it'll look silly hanging in the air forever.

3. Just do it

Finally, take an art package and animate your work. There's a full example of how to do this using *DPaint* below.

But it's all too easy to say "Just do it". What you budding, inexperienced cartoonists (or animators, if you wear suits) want are a few hints and tips, and perhaps a tutorial or two. Well, firstly, when it comes to actually drawing your little characters you want them to move in a vaguely realistic manner, which can be surprisingly difficult to achieve. There's an art tutorial that might help you, called...

Grafix

If you take a look at last month's Cover disk, you'll find a demo of an absolutely brilliant little program called *Grafix*. It's an art tutorial that takes you through the techniques you need to create decent proportioned artwork, and gives useful hints on actually animating things like people walking (viewed from different angles) and head movements. Just take a look at the strip of pics from it to the right to see what we mean, and watch out for a review of the full program soon.

Portrayal techniques

As well as the techniques *Grafix* teaches you for 'realistically' representing character movement, there are also a few classic techniques used by animators to portray what they can't actually draw.

Speed lines.

You can only move things so fast in animation. Move an object too far between frames and it looks glitchy. Speed lines work by extending the object across the

entire distance it's travelled, making it look less like a flick and more like a blur.

Stretch. In cartoons objects stretch when they move. This doesn't mean everything is elastic all of the time, but if something is falling quickly it elongates. Remember, cartoons aren't supposed to be realistic.

Eyes. Never ever try to draw either hands or eyes in your cartoons to any degree of realism. Hands should have no more than three fingers, and eyes should have no more than two colours, one of which should be white (the other should really be black).

Exaggeration. Your cartoon isn't supposed to be taken as anything other than a cartoon. Otherwise you might as well simply digitise it all, as Nick describes on page 24. So exaggerate - give people silly eyes, big noses, crap legs and strange hairdos. Like Simon, only possibly slightly smaller.

"Your cartoon isn't supposed to be taken as anything other than a cartoon. Otherwise you might as well digitise it"

SHOPPING TIME

If you want to produce your own cartoon animations, there's lots of software that will help you no end in your journey through the world of the wild and wacky...

Scanners

Gasteiner produce a hand scanner called the Alfa Scan Plus, which costs £119. If you have a Falcon the colour version is £399. Get in touch with Gasteiner on 0181 345 6000. Or there's the Power Computing Power Scanner, at 400dpi, for £99 (01234 273000). Or, to be really thorough about it, there's the ZYDEC scanner, also 400dpi from Ladbroke 01772 203166.

Art packages

There's no point thinking up wonderful, innovative, funny cartoon ideas then being unable to draw them because the art package you're using is so atrocious. There are lots of great art packages out there, including *Deluxe Paint*, which is £59.99 from Electronic Arts 01753 549442. It doesn't veer out of low resolution mode, but *DPaint* has all the normal features you'd use in the process of creating pictures on your machine, as well as an animation feature. Or you could try *Pixart*, which is £34.95 from FaST Club 0115 945 5250, or *True Paint*, £39.95 from HiSoft 01525 718181.

If you're looking for something cheaper, get yourself a

Handy Grafix extracts - read on.

ANIMATION (PROFILE WALK)
A COMPLETE WALK WILL LOOK LIKE THIS.
NOTICE HOW THE CONTACT FOOT ALWAYS CONNECTS ON THE SAME SPOT, WHILE EVERYTHING ELSE MOVES FORWARD.

ANIMATION (FRONT WALK)
WITH A FRONT WALK YOU USE THE SAME PRINCIPLES AS WITH THE PROFILE WALK, BUT YOU MUST THINK A BIT MORE WHEN APPLYING THEM. FOR INSTANCE, ALWAYS KEEP PERSPECTIVE IN MIND.

ANIMATION (FRONT WALK)
NOW ADD THE INBETWEENS AND COMPLETE THE STEP. FOR THE OTHER STEP USE THE SAME CUT FLIP AND PASTE TECHNIQUE FROM THE PROFILE.

ANIMATION (MOVING ARMS)
HERE ARE THE KEY AND PASSING POSITIONS FOR THE ARM MOVEMENT.

ANIMATION (MOVING ARMS)
BASICALLY YOU USE THE SAME PRINCIPLES AS THE LEGS WHEN INBETWEENING THE ARMS.

copy of *Crack Art* from any good PD library (see page 71 for a list of phone numbers). It won't have the kind of animation features found in packages like *Deluxe Paint* but at the price it's excellent value for money. And if you're easily amused, like we are round here, you should really

give *Art for Kids* (reviewed on page 37) a try, if only for fun.

File sequence players

The only other thing you'll need is *Animate* from Goodman PDL (it's PD) to turn any sequence of pics into a moving image. There are others, but this one's great.

3D Modelling

ANIMATION

What's behind *The Mask*? Just what makes *Jurassic Park's* raptors rapturous? What put the *Deep* into *Deep Space Nine*? 3D rendering, of course. Blast from the past Ed Ricketts puts it all into perspective (ahem).

You know where you are with a cliché, so let's start with one: 3D computer animation has revolutionised the way special effects are developed for film. Stuff like *Terminator 2*, *The Mask* and of course *Jurassic Park* just wouldn't be possible without the wonders of a Silicon Graphics machine, a fleet of animators and months of rendering time. But we're getting ahead of ourselves – tell us about the old days, Grandad.

As recently as ten years ago, everything was done by hand. Models were physically built and then altered very slightly frame by frame to simulate the illusion of real movement – even the *Star Wars* films used this method. 25 frames per second of film equals 1,500 frames per minute equals a lot of dull work for the animators, and even then the animated object looks jerky and – well, they look obviously animated.

Nowadays all the models exist only in the innards of a computer. Once a model is built in a CAD package and assigned various textures to make it look realistic, it can be manipulated in any number

of ways. All the tedious calculation of movement is handed over to the computer: you tell it where the object starts moving, where it stops, and what it does in between. Said mega-machine then goes away, has a bit of think and churns out the required frames automatically. Honestly, animators don't know they're born today.

“Once an object is built it can be blown up, stretched, squashed, and the result is always smooth yet almost photorealistic”

The advantages are enormous. Once an object is built, it can be lit in any number of ways, viewed from any angle without the need for rebuilding, blown up, stretched, squashed, whatever, and the end result is always perfectly smooth yet almost photorealistic. Easy, huh? Er, sort of...

Go on then, explain it

Okey-dokey. Most 3D objects built on a computer are composed of vertices (points in space) connected by straight edges, which together form faces. Thus they don't actually have curved edges – the illusion of curvature is provided by the rendering routines, of which more later. Obviously you don't build objects by defining every single point and then connecting them to every single edge manually (unless you're a startlingly tedious person). Most CAD software can instantly generate geometric primitives like cubes and spheres, which can be altered and joined to make the finished objects. Other more sophisticated methods of building are available, but a) they're dull and b) there isn't space to describe them.

Right, so you've got a 3D object made up of lines and points (commonly known as a wireframe model, because, um, it looks like a wire frame). The next job is to assign pictures or textures to collections of faces so that they appear to be solid objects. This is a complex art, and again we could rattle on about it for ages, but

LET'S START A MOVEMENT

1 This intro from a game demonstrates that animation needn't be complicated, despite the enormous amount of info we've thrown at you. A couple of ships fly past a planet...

2 ...and towards a space station sort of thingy. The ships are simply moving in a straight line – dead easy to set up in, say, *Xenomorph 2*, using tweening.

3 The space station then starts to flip towards the viewer. Again, this is just a matter of rotating the object on the spot, letting your ST work out the frames.

ATE!

WOULD YOU LIKE PHONG WITH THAT?

1 For test renders you can use wireframe objects like these balls on a table done in POV. They don't show much detail but they're quick for checking positioning and the like. Note you can't see the table at all.

2 Next step up is doing the flat shading, which is fine for angular objects but (as you can see with these balls) doesn't do a lot for supposedly curved surfaces. Which leads us rather neatly on to...

3 ...for a decently realistic effect, you need to add Phong shading to smooth the curves, shadows, colours and textures. Reflectivity's been added too. Not quite the most exciting scene, but it shows the rendering basics.

briefly: every texture is defined by its basic colour or pattern and its degree of shininess, reflectivity, refraction, bumpiness, opacity, and many other variables. Nearly all real-world surfaces can be created by combining these attributes in subtle ways. A glass texture, for instance, is almost completely

transparent, very smooth and refractive. The textures are 'mapped' on to the objects where needed, often being combined in complicated

ways to give the right effect. For wood, you might use a scanned bitmap of real wood, combined with a bump map and shininess.

With the models looking dead smart, it only remains to move them into the right places in the 3D world, light them, and then render them. It's the lighting and rendering stages that really provide the realism. Lighting in particular is crucial. Because in the computer's world there's no natural light at all, you have to provide sufficient to make the scene look natural while still highlighting the objects the way you want. You can use omni lights (even texture over the whole scene), spotlights, point lights (which radiate in all directions), projection lights, and others.

Finally, the scene is rendered. Rendering is the process by which

the computer, whether it's a £50,000 Silicon Graphics machine or your ST, calculates how all the surfaces look, where the reflections are, how large shadows should be, that sort of thing. There are usually various levels of rendering sophistication, which take increasingly longer to produce a finished picture. At the lowest, objects are displayed as simple wireframes, followed by flat shading which shows the facets of the objects clearly. Unless you need this sort of mechanical look, a more advanced rendering algorithm must be used. Gouraud shading and Phong shading (named after their inventors, since you asked) provide excellent results, smoothing out edges so they appear rounded and applying realistic highlights. Antialiasing is also used

to remove the 'jaggies' from the straight edges, which otherwise tend to make the scene look obviously computer-generated. At the highest end there's raytracing, which meticulously calculates the path of each ray of light that hits the objects. This provides photorealistic pics but takes absolutely ages, even on machines costing many thousands of pounds.

Once your scene is built it's a matter of moments to move the camera to a different position, or alter the lights, or change an object, and then re-render. The computer does all the dull calculating stuff for you. Yup, they may not be much cop at getting horribly drunk or driving a Golf GTi, but computers really are much, *much* better than you at computing. Surprising, that.

FIVE TIPS TO RENDERING HEAVEN

- 1** Make a sketch on paper showing roughly what the initial scene should look like and how the objects are moving. Yes, this sounds horribly low-tech, but it helps you later when you've forgotten which bit was supposed to go where.
- 2** Keep things simple at first. Compose your scene with primitives such as spheres and cubes, and use them to arrange the scene and figure out movement. Then, when the motion's right, you can do the final everything-included rendering.
- 3** To keep your animations at a reasonable size, try not to move large objects too much (especially when they're close to the

camera). Wanging an Imperial Destroyer around eats up disk space in the final animation.

4 Consider how detailed your objects need to be. If something's way off in the distance, it won't need to be that detailed. You can save time, effort and frustration.

5 Pay attention to lighting. Most beginners throw in masses of bright lights which completely wash out the scene and make it look unrealistic. A few carefully-placed spotlights should do the trick.

6 Ignore the sixth tip.

4 Finally, the name of the game is revealed. With simple linear movement, rotation and camera panning, an interesting animation is produced. Try it - you'll like it. (Cheesy grin.)

What about animation?

That's a piece of pi - er, cake, too. Any decent 3D animation package has the ability to 'tween', that is, work out the frames for the movement of objects, given a start and end position. You set up the first frame with the objects in their starting positions and the end frame with them in their final positions, specify the number of frames they should take to move, and your ST works out the in-between bits, moving the objects smoothly and realistically along their paths. If the object needs to rotate, or squash, or stretch, or whatever, you simply assign another keyframe somewhere in the sequence with this transformation applied. In this way complicated movements can be created with little effort on your part.

One thing to note. Although your initial scene may be complex and therefore use up loads of memory, the animation won't be nearly as big. After all, each frame is simply a 2D bitmap picture of the state of the objects at that point in time - it doesn't actually store the objects themselves. Also, most animation formats (particularly FLI) use a great deal of compression, storing only the changes between each frame rather than an entire picture. So if an object doesn't move over the course of 20 frames, the animator uses the data from the first frame for all 20.

It's always worthwhile checking and even editing the animation

in another package. No 3D renderer is perfect and you might want to clean up some rough edges by hand, or possibly add further effects that aren't possible with the renderer (such as speed blurs). Some packages can also compress the animation even further - lengthy process but worth it.

Do it yourself...

These days there are plenty of good 3D renderers around for the ST. Old-timers will remember *Cyber Sculpt* and *Cyber Render* (look out for them in Reader Ads) a

comprehensive modeller and renderer respectively. *Sculpt* is still the standard for creating 3D objects, though it's not that easy to use, and *Render* can produce stunning animations. Both will

run on a bog-standard 1MByte ST.

Better by far is *Xenomorf 2* (£129 from 16/32 Systems ☎ 01634 710788). This beast of a package has a full graphical front end for arranging scenes, although you still need *Cyber Sculpt* to create the objects. Multiple light sources, animated textures, 24-bit output, shadows, tweening - it's all there and fairly simple to use. Any ST with more than 1MByte will do, but you'll need a TT or Falcon to make the most of 24-bit stuff.

Raystart (£59 from 16/32 Systems) is something of a mixture.

FOR THE SLIGHTLY MORE ADVANCED...

Yes, it's a cliché to mention *Jurassic Park*, but so far it's the finest example of just how realistic film-quality 3D animation can be. In some scenes (like the raptor stampede, for instance), the effects are so good you wouldn't even realise they were computer-generated... which is the whole point, really.

■ A splendid raptor from *Jurassic Park*. This beastie was created on a Silicon Graphics machine and makes heavy use of bump mapping for the leathery hide look. Very nice.

■ Although raytracing can be slow and complicated, nothing beats it for realism. This spark plug, created in *POV*, shows what can be done with some effort.

■ The T1000 walking from the fire in *Terminator 2*. A real actor performed the movement, which was used for the animators to copy as they built the highly-reflective droid.

■ Texture mapping (wrapping pictures or patterns around an object) is the easiest way to give your models detail without actually needing to build it in. These are some of *POV*'s defaults.

Unlike *Xenomorf 2*, it includes a full 3D modelling section to create objects, which are fed to the raytracing part, which produces excellent results in a relatively short time. However, the manual's awful and the program has far fewer features than *Xenomorf 2*. *Raystart* runs on any ST in any resolution.

There's also quite a bit of PD software, much of which has featured on past Cover Disks. First there was *Persistence of Vision*

which scored a Gold-winning 90% in issue 48 and featured on Cover Disk 49. Despite a fiddly command line interface, it was popular enough to justify a *POV 2*.

Other raytracing software includes *Pearle* (Cover Disk 33) and *Volume* (Cover Disk 34). And *Ram World* isn't strictly a raytracing package, but enables you to create your own 3D worlds to explore, and scored 64% back in issue 38. See page 85 for back issues.

PERSISTENCE OF VISION

No doubt about it, raytracing is the way to go if you want spectacularly realistic pictures. But, and this is something of a Bernard Manning-sized but, you have to be prepared to put in a lot of effort. The best raytracer on the ST (and indeed on any other platform) is undoubtedly *Persistence of Vision 2*, or *POV 2* as it's known down the pub. Plus, it's free from any good PD library. Completely. No money to pay. Zilch.

POV 2 isn't exactly the most user-friendly program you'll ever use. There's no graphical interface at all, so you have to build all your scenes by defining them in a script file. This is fed to *POV*, which crunches away for a bit and then spits out your picture. That's fine for simple stuff like spheres, but when you start trying to build a 1/25th scale model of the Taj Mahal, things get a little complicated. The glorious picture in your head rarely matches the mess of shapes and colours *POV* cruelly throws back at you. A head for maths and plenty of spare time are prerequisites.

Nevertheless *POV 2* is capable of amazing results given time. It's provided with umpteen sample files and studying these

■ Okay, it's twee, but it's also bloody impressive. Check out the Graphics Development forum on CompuServe for hundreds more pictures like this.

should help enormously with your own efforts. There are also squillions of source files on CompuServe and other BBSs, along

with some truly amazing pictures. Seek it out, master it, and be the scourge of your enemies (possibly).

FALCON FROM ONLY £399!

- System Architecture:**
- CPU: Motorola 68030 operating at 16MHz
 - BUS: 32-bit data, 32-bit address
 - FPU: Optional Motorola 68881/2 - 16MHz
 - RAM: 1, 4, 14mb configurations
 - ROM: 512K

- Digital Signal Processor:**
- Motorola 56001 DSP running at 32MHz
 - 16MIPS performance at 32MHz
 - 32K 16-bit Static RAM

- Interfaces, Ports & Expansion Slots:**
- Internal direct processor slot
 - SCSI-2 Port with Direct Memory Access
 - High-speed LocalTalk/AppleTalk compatible LAN port
 - Connector for VGA, composite video, RF (cable supplied), or broadcast analogue RGB (monitor output requires adaptor) - see below
 - Bi-directional parallel printer port

- Data Storage:**
- 1.44mb Floppy Disk Drive
 - Internal IDE Hard Drive Option (127 or 209mb HD versions available)
 - MS-DOS format compatibility

- Graphics:**
- VGA: 640 x 480 256 colour
 - True colour 16-bit mode; display up to 65,536 colours from a 262,144 palette
 - Accepts ext. video sync signal for genlocking - up to 65,536 possible colours from a palette of 262,144
 - Hardware-assisted horizontal line scrolling
 - BLITTER graphics processor

- Sound:**
- Eight 16-bit digital audio DMA record and playback channels (up to 50kHz sampling)
 - Stereo 16-bit DMA input & output
 - SOMA sound/DMA co-processor

- System Software:**
- Multiple window user interface with icons and dropdown menus
 - Icon-based graphics user interface with self-explanatory command functions
 - Multi-tasking operating system with inter-process communication (MultiTOS)
 - On-line help
 - NewDesk desktop and extensible-control panel allows customisation

£100 OFF!

- Two 9-pin joystick connectors
- Two 15-pin enhanced digital/analog connectors

INCREDIBLE POWER

At the centre of the Falcon 030 lie two powerful hearts: the super fast 68030 processor which runs 4 million instructions per second and the Motorola DSP 5601 processor. Working together, they give processing speeds up to 10 times quicker than any comparable price. The Falcon 030 also boasts an impressive array of interfaces for linking peripherals.

THE IMPACT OF COLOUR

The Falcon 030 produces images indistinguishable from a real picture displayed on your TV. Every pixel on screen can be shown in a different colour and 65,536 colours can be displayed at once, from a palette of 262,144, producing a true colour display of the highest quality.

SUPERB VIDEO

The Falcon can be used to create special effects, overlay pictures, lighten any that are too dark, even get rid of the unfocused bits. Video editing and special effect techniques are both easy and affordable.

CD QUALITY AUDIO

The Falcon 030 comes complete with a stereo input into which can

be plugged a microphone, a Walkman, or a hi-fi system. To reproduce the sound, a converter mixes the eight 16-bit channels, then outputs crystal clear stereo sound at a sampling frequency of up to 50kHz, better than CD quality. The Digital Signal Processor with direct-to-disk capability, means that the Falcon can store sound samples, including the human voice, on hard disk and play them back in real time.

2 PROCESSORS

Motorola 68030, 16MHz, 32-bit Processor + Unique 32MHz DSP (Digital Signal Processor)

CD QUALITY STEREO SOUND

8 x 16-bit Digital Audio DMA Channels

Video

ANIMATE

Nick Peers loudly told anyone who'd listen that he and his ST were taking over production of the latest Hollywood blockbuster...

You might think that movie-making is an expensive option, what with the cost of cameras, editing equipment, stars, location shots and the like. But we're going to show you how to produce your blockbuster on a shoestring budget with your ST as the central figure. You can shoot your movie in your backyard, then, armed with this invaluable tips, turn it into the film everyone will be talking about for the next decade. Erm, maybe.

Over the next few pages, you'll find out how your ST can do all your editing and special video effects for you (it can even transport your leading man to the moon. No, it can). In fact, the only limit, apart from memory and disk space, is your imagination. Oh, and the footage at your disposal. We're not going to concentrate on the actual filming, here, so don't get ready for "Action", but be prepared to wade in with your ST on the sound of "Cut, that's a print!"

Editing your movie

How can your ST be used to good effect in creating cinematic masterpieces? Well, you obviously need the raw data first (see the next page), and there's all manner of wonderful things you can do to it, as long as you have a digitiser like Videomaster or VIDI-12-ST.

One obvious advantage a digitiser has over video is its superlative editing techniques. You can scroll through your grabs a frame at a time, cutting and pasting as required, and before you know it, you're in the process of editing your own movie. Your ST is the only viable and cheap enough way you're likely to find to edit footage effectively.

Video Effects

There are several special effects you can perform using video. One of the earliest was to create the

illusion that people were somewhere they weren't. In early *Tarzan* films this was achieved by having the star stand in front of a huge screen displaying the backdrop (a cliff face perhaps). Not convincing.

The technique improved, however, so that in 1979 the posters for *Superman* proclaimed "You'll believe a man can fly!" By 1994 cinema goers were shaking their heads to remind themselves that Tom Hanks, as *Forrest Gump*, was not really there shaking the hand of John F Kennedy, but was in fact cleverly superimposed on to a piece of old news footage.

Your ST can do this, too. Once you've got your two pictures you can import them into an art

"Scroll through your grabs, cutting and pasting as required, and before you know it you're editing your own movie"

Save yourself loads of memory by reusing sequences and reversing them. With Videomaster, it's easy using the powerful software provided.

SUPERIMPOSITION

1 You first need your background image. Here, we've grabbed a scenic still of Mount Everest. Note the fact that it's in monochrome to ensure that there's no clash of palette with the foreground character.

2 Next, we need our character. And guess what! It's a picture of me. All ready to bounce along the foot of Everest (don't ask why, please). Clothed in, er, a nice black sweatshirt and waterproof specs. Or something.

3 Next, using your art program (in this case, *Degas Elite*), first cut and then resize the foreground picture, so that it's not going to overwhelm the background. There is a loss of quality, but this isn't Hollywood y'know.

ATE!

■ Morphing enables you to merge one object into another. Here, Kirk would have looked like had he been a Vulcan. Beats his human incarnation, anyway.

package and, using its Block functions, superimpose one picture on to another. Well, it's one way to achieve your mum's dream of meeting Cliff. Animating such a sequence is tricky, but if you've got the patience you could do it: see the walkthrough below for details.

Morph...

...is the name of a Plasticine character created by Tony Hart, and illustrates another video effect that's easy to perform on your ST (stop-motion - see below). It's also the name of an increasingly realistic video technique which transforms one object into another through a sequence of animations. It has been seen to good effect in

Terminator 2 and *The Mask* as well as *Star Trek: Deep Space Nine*.

There is software available that enables you to morph one image into another. The majority of these work by creating 'inbetween' images that are stored to disk as separate pictures. You can then watch the morph in action using a slide-show program or another animation player. Look at that picture of Spock and Kirk combined for an idea of what can be achieved.

Stop, now go

Stop motion is one of the most powerful video animation techniques you can use with your ST. The theory behind stop-motion filming is the same as cartoon animation: each frame is set up and grabbed individually, and then run in a sequence to simulate animation. Stop-motion photography involves animating real 3D objects rather than drawings, which eliminates the need for drawing anything (although modelling is a skill you might consider). Requirements include a camcorder, your models (or a huge lump of Plasticine), admirable patience and huge amounts of memory if your animation is to be ultrasmooth. We would have given it a shot, but Trent refused to let us approach the plastic Godzilla that stands on top of his Mac as our possible star.

All together now

But don't limit yourself to just one of the above video effects. Why not

combine them all to produce the ultimate five-minute movie? You could begin with a live action sequence, with your star running towards his spacecraft as he's swiftly pursued. Then cut to a stop-motion sequence where you see his craft take off and escape into

space (perhaps even using a superimposed effect). Finish with a morphing technique that sees your character reverting from human to alien form, then tack on an end credits sequence if you're really pleased with your efforts. Turn over the page to find out how.

WHERE DO I GO FOR THE PICCIES?

Film, following in the footsteps of photography, is based on light. As video cassettes prove, this light can be stored as electronic information. Because your ST and Falcon also deal in electronic information, the two are compatible - a good thing or else this feature would have ended here.

You can get still and moving pictures from a variety of sources. Photos can be obtained in one of two ways. The easiest is by transferring them on to Kodak PhotoCD, which stores them electronically in such a way as to be easily interfaced to your ST via a CD-ROM drive. The second way is to convert them for use on your ST is via a scanning device.

An easier method of obtaining footage, especially for use in animation, is to grab directly from video sources such as TV or camcorder. This method not only provides you with your drawings, but your basic animation too. For this, you need a video digitiser,

such as Videomaster or VIDI-12-ST. Although the results are not quite TV quality (they're monochrome for a start, unless you grab them a frame at a time using a perfect freeze-frame video), you'll be surprised at how well defined they are, even with Videomaster's quarter-screen size.

Memory and disk space are also restrictions you must consider. VIDI-12-ST, which grabs full-size screens at 8 frames per second, needs 4MBytes of RAM to score 70 frames (less than ten seconds of continuous footage). Videomaster is less restrictive, because it grabs quarter-screen size chunks, which means that you only need 1MByte of RAM to store the same length of footage.

A hard drive is also a definite must if you want to save out the footage and create massive sequences, and see the next page for some general hints and tips for making the most of what memory you have.

4 Having saved your background picture as frame 1 (which you've done, of course), paste your foreground picture in the appropriate place on the screen. Save this picture as frame 2 before reloading frame 1 into memory.

5 Next, repeat the pasting process, this time remembering to paste the character in a slightly different position to create the illusion of animation. Aim for about 20 frames (if you have 1MByte of RAM, that is).

6 To display your animations, you need a slide show program that loads the pictures in all at once. Try using the Videomaster software (Cover Disk 59) and load in the pictures a frame at a time using the editing screen.

HINT 'N' TIPS

When it comes to creating your own video animations, there are a few things you should probably bear in mind.

Memory

Remember your machine's limitations. Even with a 14MByte Falcon and 209MByte hard drive you're still going to run out of memory and disk space quickly. Here are some essential tips to make the most of what you have:

1. When editing your footage remove as many of the 'inbetween' shots as possible. Try going down to about six fps. While some smoothness is sacrificed, the memory you save will be there for other sequences.
2. Reuse the footage as often as you can (play it backwards, for example). If you're animating a bird flapping its wings it's as effective and much less memory hungry to just store the footage for the wings flapping one way, then reverse the sequence to complete the effect.
3. Avoid long-winded footage that does little except use up vast quantities of memory space. Keep your sequences short and sharp.

■ The picture has been changed by giving it sharper shades of black and white. We've also erased a lot of the extra background data.

4. Pad out your footage by using lots of stills or by reusing sequences. If you're creating a music video using your favourite band, for example, try repeating a sequence of the lead guitarist thrashing away in the background. Brian May, for instance.

Morphing

Morphing is difficult to achieve using digitised images because, unlike drawings, there is so much more extraneous data (such as backgrounds) which can confuse the program and create problems.

1. Keep the start and end images as similar as possible. So don't try to morph a photo of your hamster

COPYRIGHT, EH?

There's no restriction on what material you use if you keep it to a strictly personal use. Start distributing it, even for free, and you'll be breaching various copyright laws. So while it's fine to show your mum and little sister what you've done with your favourite rock group, don't copy the footage on to blank disks to give to your friends. If you want to create footage to distribute in any form whatsoever your best bet is to get a video camera and create your own original footage that won't lead to troubles over copyright

■ Don't forget, copyright laws prohibit you from distributing any digitised animation that you create using copyright material. Such as videos of your favourite rock group.

and possible prosecution. *Star Trek* is out, as is *Tarquin's Dodgy Space Movie* that cost £10 to make, sadly.

2. It's an advantage if the two images (for example, two faces) are similar sizes and face the same way. If one wears glasses, so should the other.
3. Try to define as many points of change on the two pictures as you can (use the smallest grid size in

■ We gave away *Morph* on Cover Disk 59, and it has almost as many features as *Metamorphosis* (on page 29).

4. To improve the smoothness of the morphing process, create as many frames of animation as memory or software permits.

WHAT DO YOU NEED?

Video animation is much more hardware orientated than other two types. That's because we video peeps can't be bothered to draw (*can't draw, you mean - Andy the art ed*). It's just too much effort.

Videos

You need a video source from which to grab your animation sequences. The one you're most likely to have is a VCR - they start from as little as £150. If you're after one that enables you to grab perfect still frames then you need a VCR with a freeze-frame facility (£300 upwards).

If you want to use your own original footage, you'll need a video camera. These can start from as little as £100 for a second-hand black-and-white closed circuit camera (as used in shops), which is perfect for your ST because it can't grab moving frames in colour anyway.

Digitisers

There are two currently available for the ST. Videomaster from Microdeal (94%, £99.95) enables you to grab quarter-screen-sized moving images, but also supports sound. VIDI-12-ST (80%, £54.99 from First Computer Centre ☎ 0113 2319444) is more memory hungry,

but does enable you to grab full-screen moving images.

We've also been reporting on a cheaper digitiser called the DV3 that's under development (see issues 59 and 64). It will cost around £40 and will enable you to grab still images in monochrome, even if your video doesn't have a perfect freeze-frame facility. Stay tuned for future developments!

Software

There's plenty of software available to enable you to get the most from your movies. Obviously, all the digitisers come with their own built-in software for grabbing and editing footage, but there are a few other

programs that can make your video productions even more impressive.

Art packages: We featured a big round-up of art programs in issue 61, and Simon's listed a few good 'uns on page 18, and they're invaluable for pruning your frames to achieve the desired effect. You can use them to develop your sequences to meet your exacting requirements - add elements or strip them away for example. Why not use them to recolour your images even? Give that photo of your best mate a green tinge to give him the alien look.

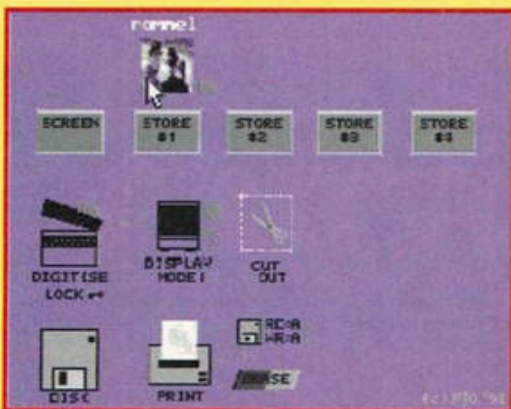

Morphers: We gave away *Morph* on Cover Disk 59, which can be used to create basic morphs

between two pictures. The software isn't really suited to morphing two digitised pictures however, as I found to my cost when I tried to turn myself into Superman. We've also reviewed a new morphing package this issue (*Metamorphosis 24* - see page 29) which is far superior to *Morph*, but then for £80 what do you expect? It only works with TIFF

images, which means that your pictures grabbed from Videomaster (which are Degas-compatible) will need converting using a program like *GEM-View*.

Video titling: Computers can be used at the most basic level to add footage to your holiday movies by creating credit lists. There are two types of software you can use, the first of which involves creating attractive sequences upon which you can display who's who in your films. Several are in the public domain: *Creative Titler* (1 MByte), for example. For a more professional look you might like to use a genlock device, which enables you to overlay your credits on top of your actual video. There is currently only one genlock for the ST, the Hama Trilock Genlock, £324.99 from the First Computer Centre, which scored 85% in issue 59. Its use isn't just limited to adding a credits sequence - you could use it to label certain parts of the footage (the spot where your dad later fell into the sea off-camera, perhaps?).

If you're interested in learning more about editing and video animation, turn to page 85 to order your copy of issue 59 where we not only gave away the Videomaster software on the Cover Disk, but featured a four page tutorial on how to use the software constructively.

■ The DV3 video digitising package could well be the answer for those of you working on a shoestring video budget. But what's the question?

SILICA ARE NOW IN 18 BRANCHES OF
DEBENHAMS
 SEE BOTTOM PANEL FOR DETAILS

Look out! There are some stray cats coming into the country! Some USA Jaguars have been imported into the UK unofficially. This imported product has been manufactured for America and is not compatible with UK Jaguar equipment. Look out for the UK sticker above on the Jaguar products you buy. This will ensure it is official product and will work properly in the UK.

AWESOME SOFTWARE

SOFTWARE UPDATE AS OF MID-NOVEMBER '94

There are now more than 150 developers signed up to produce Jaguar software titles, with over 50 titles in progress. The following are the current titles, with Atari's release dates.

Alien v Predator - JGS 1152	NOW	£54
Club Drive - JGS 1794	NOW	£49
Crescent Galaxy - JGS 1852	NOW	£39
Doom - JGS 2282	NOW	£59
Dragon - Bruce Lee Story - JGS 2272	NOW	£54
Evolution - Dino Dudes - JGS 2452	NOW	£39
Raiden - JGS 6722	NOW	£39
Tempest 2000 - JGS 7472	NOW	£49
Wolfenstein 3D - JGS 8922	NOW	£49
Brutal Sports Football - JGS 1532	NOV '94	£54
Chequered Flag - JGS 1761	6/12	£54
Iron Soldier - JGS 4011	14/12	£54
Bubbsy the Bobcat - JGS 1981	22/12	£49
Kasumi Ninja - JGS 4552	31/12	£59
Air Car Wars - JGS 0671	DEC '94	TBC
Cannon Fodder - JGS1704	DEC '94	£39
Double Dragon - JGS 2181	DEC '94	TBC
Flashback - JGS 2671	DEC '94	TBC
Pinball Fantasies - JGS 5931	DEC '94	TBC
Rayman - JGS 6891	DEC '94	TBC
Sensible Soccer - JGS 7011	DEC '94	TBC
Syndicate - JGS 7301	DEC '94	TBC
Theme Park - JGS 7301	DEC '94	TBC

PLAY WITH THE FUTURE NOW!

- SUPER CONSOLE! AHEAD OF THE PACK**
Atari's Jaguar offers more power than any other system. It is totally futureproof with the power of virtual reality and remote gameplay via modem expected during next year.
 - PLAY FROM ANY VIEW**
Change play perspective. View gaming areas from above, left, right, behind or in front.
 - ZOOM IN FOR CLOSE UP ACTION**
Jaguar allows you to zoom in on any part of a game's play area.
 - SAVE STATE OF PLAY**
Store those high score tables and game positions in special random access memory stored on the cartridge.
- EXPECTED DURING '95**
- LINK UP WITH 'CATBOX'**
The optional extra Catbox plugs into the back of your Jaguar, enabling you to connect a wide variety of add-ons simultaneously. Facilities include the ability to link up to 32 Jaguars together for multi-player games such as Doom and Club Drive.
 - CD-ROM FILMS & UNBELIEVABLE GAMES**
Tap the power and speed of CD-ROM with Atari's Jaguar add-on (expected Jan/Feb '95). Play bigger 3D games, standard audio CDs and films (with optional extra FMV module). The CD-ROM drive also includes a virtual light system, which creates an interactive light show in time with CD audio output.
 - VIRTUAL REALITY'S COMING**
Watch spaceships whirl around your head, laser bolts slice past you, sounds of destruction fill your head as you become part of the game. Jaguar's virtual reality helmet is expected in 1995.
 - CONNECT WITH A WORLD-WIDE NETWORK**
In the world of Jaguar, distance means nothing. Play against Jaguar owners in New York, France, Greenland or even Australia. Plug in your optional virtual reality helmet, and do battle in cyberspace with players from around the world. There is nothing like it!

THE WORLD'S ONLY 64-BIT CONSOLE

- 64-BIT DATA BUS
- 5 Processors
- 2Mb 32-BIT RAM
- Spectacular 32-BIT Graphics
- Unique 360° Gameplay
- 3D Game Worlds with No Restrictions
- 16.7 Million Colours
- CD Quality Stereo Sound
- 17 Button Controller
- Plugs Straight into a TV
- Free Cybermorph Game
On Cartridge - Worth £39 inc VAT

CD-ROM ADD-ON

EXPECTED JAN/FEB '95

FREE! CYBERMORPH WORTH £39

SAVE £30 OFF RRP OF £229.99

JAGUAR CONSOLE + CONTROLLER PLUS CYBERMORPH GAME

£199

Ladbroke Computing

33 Ormskirk Rd,
Preston, Lancs,
PR1 2QP

Ladbroke Computing International are one of the longest established home computer dealers in the U.K. We have developed an extensive customer service policy which involves testing of all hardware prior to despatch to ensure that goods arrive in working order, offering free advice and support over the phone and keeping customers informed. Although our prices are not always the cheapest we do endeavour to offer consistently good service and backup.

All prices/specifications are correct at copy date 17/11/94 (while stocks last), and are subject to change without prior notice. All prices include VAT but exclude delivery.

How to Pay

You can order by mail, Cheques/Postal Orders made payable to Ladbroke Computing. Or give your credit card details over the phone.

Delivery

Postal delivery is available on small items under £40 (Normally £3, phone for details). Add £7 for courier delivery. Next working day delivery on mainland UK subject to stock (£20 for Saturday delivery).

Open Mon-Sat 9.30am to 5.00pm.

AT Speed STFM (8MHz) £139.00

Falcon Speed £POA

Repair Services

The Only ATARI Authorised Repair Centre in the UK

Our Atari trained technicians can repair ST's in minimum time at competitive rates. We can arrange for fully insured courier pickup and return delivery of your machine to ensure its safety. We even have a same day service which will ensure your machine is given priority and subject to fault, completed the same day.

We can fit memory upgrades PC Emulators, Security devices, ROM upgrades, hard drives to Mega STE's etc.

We offer a Quotation service for £15 for which we will examine your machine and report back with an exact price for repair, if you do not wish to go ahead with the repairs then just pay the £15. However, if you do go ahead then the charge is included in the minimum charge.

Please note. The minimum charge covers labour, any extra parts are chargeable.

Quotation	£15.00
Minimum repair charge	£35.25
Same day service	£15.00
STFM(E) PSU	£29.99
1Mb Internal Drive	£19.99
TOS 2.06 + Switch STFM	£54.99
TOS 2.06 + Switch STE	£54.99

Courier Pickup	£11.00
Courier return	£7.00

Monitors

ST Mono Monitor £99.99

High quality 14" SVGA Monitor with ST adaptor (includes sound). Fully compatible with all ST Hi-Res Programmes with tilt/swivel.

17" Multisync Monitor. £559.99

.26 dot pitch.

20" Multisync Monitor. £759.99

.31 dot pitch.

Colour SVGA Monitor £239.99

High quality colour SVGA Monitor, .28 dot pitch includes Falcon adaptor.

Microvitec 1438 MultiSync £289.99

The Microvitec Multi-Sync displays ST Low, Medium, High resolutions using ST switch box, compatible with FALCON & FALCON screen blaster using FALCON VGA adaptor.

ST Multisync switchbox £14.99

Falcon VGA Adaptor £9.99

Falcon ST monitor Adptr £9.99

Philips SCART to ST/STE £9.99

8833 MKII to ST/STE £9.99

Metamorphosis

24

Giggling with genius insanity, Simon told his Falcon to morph him into a talented, gorgeous writer. Then, disgruntled, he sat down to write this review instead.

You're watching a wonderfully written, tensely directed thriller, and you spot the final sequence coming up. It's all or nothing. This could turn out to be one of the all-time epics of cinematographic history, or a dull pile of old nob. And just when you're right on the edge of your seat, wondering if you'll ever breathe again, they use some cheap morphing effect.

When the idea originally made its way on to our screens, notably (well you couldn't miss it could you?)

in *Terminator 2*, everyone agreed that morphing was one of the most realistic special effects ever. It really did look as if it was possible. But ever since that fateful day we've

been bombarded with cheap excuses for plot developments, 'brilliantly original' ad campaigns, tatty rock videos and any other visual 'treats' that can find an excuse to use the system. And since you own an ST, it's possible for you to create your own effects along the same lines. *Metamorphosis 24* is the package that

gives you that ability, although obviously without the resolution or speed you'd get from the kind of graphics workstation they used for *Terminator 2*.

Built for idiots

The first thing you notice about *Metamorphosis 24* is that it's laid out with simplicity in mind. Using a GEM-style interface, you can load up your start and target pictures in windows, the status and information window sitting neatly out of the

way. All other pictures that you create from the menu options appear in boxes of their own. Slowly.

That's right - a morpher like this isn't just a

picture creator, it's a set of complex mathematical algorithms employed to do something that's incredibly difficult for a computer. For speed reasons, a separate version of the software has been provided to run on the Falcon 030 and TT, making use of the maths co-processor to try to speed the process up a little.

The package works on two levels. First of all, it can calculate a mix picture, working with two images to create a third. For instance, with the demonstration images provided you could create a picture that was half Kirk and half Spock (50 per

cent), or Kirk with just a slight hint of Spock (10 per cent).

These are examples of the files that the program saves to disk, whereas the pic below shows the poor quality of their screen representations. Shame. Anyway, who needs Industrial Light and Magic?

"It's fun for the first five minutes, but dull after that. It morphs, but do you really want to?"

How does it do that, then?

When it's morphing one person into another, how is your ST supposed to tell a nose from an ear, to say nothing of dealing with everything else from cars through wild animals all the way to text (now there's an idea)? Well, you're given the chance to plot nodes and lines on to your picture, dictating which

parts go where. For instance, in our Kirk/Spock example, a diamond has been plotted around the mouth on both pictures, so the program knows exactly which bit to change and which bit to keep roughly the same. You do this for things like hairlines, eyes and nose too. Dead easy.

Moving pictures

Its second ability is to calculate animations, saving frames, which are then used create a full morph sequence, to disk. This however takes an ice age. If you don't mind leaving your machine on overnight you can create some impressive animations, but don't expect to sit and watch while it works them out. A separate program has been provided for viewing these files, enabling you to view the files in sequence as a movie, and you could patch something up to get these frames on to video (you can use a composite output to video using the player, or turn to page 24 for more advanced results).

So do you have any use for a morphing package? If so, do you have any use for a package with more facilities than *Morph* (on issue 59's Cover Disk)? If so, *Metamorphosis 24* gives you a few extra options. It's fun for the first five minutes, but dull after that, serving no real purpose except for brief entertainment. It morphs, but do you really want to? **stf**

Also needed

One of the first things you can do with *Metamorphosis 24* is test the package out on the images provided with it. However, there's only so much you can do with 400 pictures of Kirk in various stages of Vulcan transformation. Here at ST FORMAT, we have picture files coming out of our ears, because we use them in other aspects of magazine production. You, however, may be stuck for pictures to use. This means either finding yourself a digitiser or using pictures you already have. Or you even could use images from the PD CD reviewed on page 39 of this very ish...

Metamorphosis 24

70%

So just how does Prince of Persia work?

We've told you how to produce great-looking animations using a number of different techniques, but these are strictly non-interactive affairs. How do programmers animate characters in games without knowing what you'll do next? Well, the principals are the same, but the game has to wait for your joystick movements before it decides which frame to call up next.

The first step is for the artists to draw the characters. They examine the brief (to see what each character has to be able to do) then break down all their movements into individual frames. These are drawn against a neutral colour that isn't used in either the game's backgrounds or the characters themselves. These frames are drawn on an evenly spaced grid, one frame to each rectangle of the grid.

The top left corner of each rectangle has a reference number. These rectangles form the frames from which the animation is built. The program is 'told' which frames follow which, so that when you move the joystick it knows which three sequential frames make the character stand, jump and land.

Suppose the character is standing still and about to start walking to the left. While the current frame (the one you're watching on screen) is drawn, the computer reads the joystick port. The animation routine is examined and the correct 'rectangle' for walking left is called from the grid via its reference number.

This frame is then placed on to the background graphics in RAM - all while the screen you're currently watching is still being drawn.

But if the character was slapped straight on top of the background graphics there would obviously be a huge rectangle around him, which would ruin the effect. To stop this, the neutral colour is masked out, and the character simply stamped on to the background graphics. This happens just as the display of the current screen finishes, and the new screen - composed of background graphics and stuck-on character - is displayed.

This means that a character can be displayed anywhere, on top of any background graphic and you can still see between their arms and legs. It also means that they are smoothly animated without relying too much on a preset series of animations.

There's no need to draw the character facing both left and right - your ST takes one frame and flips it vertically. Similarly the transitional frames between crouching and standing can also be used when the character lands, or when he crumples in a death animation.

Prince of Persia is the classic animated game, and introduces a heightened element of predetermined animation into the affair. Rather than the character turning instantly or stopping on a six-pence on your instruction, the programmers forced a level of real-world physics into the equation. If the Prince is running, he has to slide to a stop. The second the joystick goes into the stop position after a run, the next few frames (covering the slide, the gentle halt and that famous body wobble) are chosen by the program and he slides to a halt. And wobbles. Simple and highly effective. **stf**

GREAT GAME INTRODUCTIONS

Unless you have a hard drive the size of Kent you're not going to be knocking up *The Lion King 2* on your ST. But to give you an idea of the kind of thing you can achieve (or be 'inspired by'), go through your games back catalogue and take a peek at the intros. You know, the bits you always skip. These not only set the tone of the game (and often stand in for the gameplay) but also make great screenshots, and might inspire you in creating your own animations. Here's our top ten:

- 1) **Chuck Rock**
 - 2) **Thunderhawk**
 - 3) **Lemmings**
 - 4) **Predator 2**
 - 5) **Populous 2**
 - 6) **Robinson's Requiem (Falcon)**
 - 7) **Epic**
 - 8) **Killing Game Show**
 - 9) **Frontier: Elite 2**
 - 10) **Dragon's Lair et al**
- (So *Dragon's Lair* was virtually all intro, but forget the gameplay, just look at the animation on that!)

IT'S ON THE DISK!

So you've read the feature, made the flickbook, had the idea and want to get started? You need *Animate 4*. This file sequence player enables you to play all those SEQ and DI? files you've knocked up in *Cyber Studio*,

Cyber Control and *Cyber Paint*. Follow the instructions on how to decompact *Animate 4* from the Cover Disk (page 6), then double-click on ANIMATE.PRG to run the program. Once it's booted up click on the SEQ button which

will take you to a file selector that enables you to access the two example files (BUZZBEE.SEQ and CUBE1.SEQ). Watch them and go "Ahhhhh, isn't that pretty?" Then get your *Cyber* goodies out and start creating. If you

haven't got the *Cyber Suite*, don't panic. 16/32 Systems are selling *Cyber Paint v2* and *Cyber Control* for £25 each and *Cyber Studio* for £15. Just give them a call on 01634 710788 and they'll get you animated!

PROFESSIONAL FOOTBALL MASTERS 4

Games : Yearly fixture/previous list, Week fixtures/results, Results from previous meeting with opponent (goes back up to 6 seasons).

Players : Real life statistics reflecting the start of 93/94 season with real positions, height, age, Live transfer market, Contract & wage negotiations, Preferred foot (left/right/both), Leans, Injuries, Training, Special talents, Trainees, Goalkeepers (separate skill categories), Defenders, Midfielders, Attackers & Utility, Retirements, Foreign transfers, Unhappy players, Top 10 Hot shots.

Team : Training, Tactics (15 different styles), Aggression, Formation allows specific player field settings (Left winger, Sweeper etc.).

Club : Sponsorship, Ground improvements, View opponent, Finances The Match : Real time scoreboard reporting goals & injuries yellow/red cards, Sound effects, Interventions permitted at any time to change tactics, formations and make subs. Physical graphical penalty participation (optional). Over 80 different referees.

Other : Fast load/save, Printer access, 20 Options to set various game preferences, Instruction book, Easy to play, Technical support.

Plus : Over 100 other meticulous refinements impossible to list here.

Editor : Allows you to amend various items in saved games. £12 Extra

Scottish : Dedicated version full details upon request.

Quite simply the best Football management game for your computer.

We have served thousands of satisfied customers during our 4 years of trading. Over 10,000 man hours (during 5 years) has been dedicated to the production of this constantly improving game. It is one of the most realistic and accurate representations of a professional football managers annual challenge to tactically outwit and conquer every opponent.

Managers : 1 to 4 Human players, Ratings, Performance statistics, sack and offers, 3 Difficulty levels, Manager of the month and season awarded, Pools, Pick any team in any division to begin with.

League & Cup : Premier 22 teams, Division 1, 2 & 3 have 24 teams, Play-offs, Tables, 7 Cup competitions with precise rules (2 legs, extra time, away goal rule, seeded draws, European Cup tables, 5 subs, non-domestic player restrictions etc.), Finalist route to glory.

STABLE MASTERS VERSION 2

This game has been designed to be as close to real racing as possible. Five years of development by a clever racing expert has led to the second revision of this Flat Horse Racing Simulation.

Up to 4 players can participate as Owner Trainers with the primary objective of becoming the top rated trainer, in respect of prize money won, at the end of each racing season (March to November). There are up to 35 other intelligently controlled computer trainers to compete against and compare your personal performance. To achieve this aim you must discover a potential champion and train them so that they become capable of competing well and winning any of the 47 big prize money races (Handicap and Group), eg. The Derby. To give you an idea of the tools provided in this game to assist you reaching your objective we have listed the main features below:-

- 250 horses each with over 60 independent variables.

- 26 different race courses (2 all weather), real life characteristics mirroring the diversity of racecourses in the UK (descriptions provided).

- Formbook and Win Summary Cards cover the previous 200 races.

- Animated race display or just the result. View Declaration List for races.

- 20 Jockeys who vary in ability and booking fees, Orders & Feedback.

- Very informative report by Head stable lad, Tipsters, Bookmakers.

- Racecards similar to racing press. Real life, Handicaps & Race Types.

- Injuries & Vets, Load/Save game, Many other items included.

CRICKET MASTERS

This is a purely managerial cricket manager game that concentrates on strategy and includes plenty of relevant statistics. The game has been designed and developed by a true fan of the sport. It replicates everything that a real manager has to contend with and it's a totally unique production that all Cricket fans should experience.

A summary of the main features is shown below:-

- AXA EQUITY & LAW 18 league county teams, 50 overs per game.

- 4 Cup competitions including Benson & Hedges, Nat West.

- 20 different match umpires with accurate names and strictness.

- Accurate player details Surname, height and age.

- 27 different player attributes. Most skills have a direct impact on the effectiveness of each individuals actions during a simulated match.

- Easy player selection. All game text is clearly presented.

- Batting and bowling averages. Top batting and bowling tables.

- 3 Different training intensities to boost batting, bowling or fielding.

- Weather, pitch and light often make an impact on ground condition.

- Full match highlights let you watch the action ball by ball with full graphics and/or realistic sampled sound effects for significant events (Fours, Umpire decisions, etc.). Interventions are permitted at any time to change batting tactics or fielding placings.

- 3 Batting/Bowling classifications.

- 15 different field placings.

- Full scorecard results with best batting and bowling figures.

- Other staff (Physio, Groundkeeper, Scout) can be hired and fired.

- Annual league fixtures listing. Current week and last league results.

- View current cup competition draws and historic records.

- Real time transfer market. Player contract and wage negotiations.

- Sponsors, Finances, Poor ground fines, Manager rating.

- 15 Options to alter game prefs., Load & Save game, Printer access.

- Full instruction book with plenty of examples. Plus Many More.

WORLD CUP CRICKET MASTERS

A fantastic graphical and/or tactical representation of Cricket that has been completely written by a traditional fan. You can physically participate with batting and/or bowling or leave it to the computer to automatically handle. See full feature list below:-

PLAYER VARIETY

- Rated on 8 adjustable factors.

- Left and right handed players.

- Range of batting types.

- Editor to amend game stats.

- Bowler types include seam, swing, change and both types of spin with 8 speed levels.

GAME OPTIONS

- 1 Day limited overs or test.

- White or coloured clothing.

- Three Cricket grounds.

- Load/Save game, Skill levels.

- Computer/Human players.

FRIENDLY CONTROLS

- Icon driven with point & click.

- Large 3D scrolling screen covering the entire playing area.

- Mouse controls bowler's line, length, direction field settings.

- Joystick control of batsman's attack level, strokes and running between wickets.

STATISTICS

- Scorecard & bowling analysis.

- Weather and ground reports

- Wagon Wheel

- Manhattan Chart.

VARIABLE CONDITIONS

- Surface and pace of pitch

- Rain, bad light, cloud cover, temperature and humidity.

ANIMATED ACTION

- Sound Commentary.

- Umpire signals.

- All the strokes cut, pull, drive, etc.

- Appeals, dropped catches, run outs.

- Bouncers, wides and no balls.

Best Software Upgrade 1993 & 94 - ST Review.

Magic

Runner Up Best Software Upgrade 1994 - ST Review.

"If you want a multitasking system that works simply and reliably, then Magic is for you."

ST Review, June 1994.

Magic is a full TOS replacement; a very fast disk filing system; has accelerated serial, midi and printing routines; and is, of course, a true preemptive multitasking system. Magic Desk, a replacement Desktop and a powerful command shell are included. Magic runs on all ST, Mega and TT computers with 512Kb, but 2Mb is recommended for a useful working system.

The Falcon version is expected later this year.

"It's like running an accelerator and getting the multitasking thrown in for free."

ST User, February 1994

Magic (RRP £69.95) Intro Price £59.95
Magic and Ease £99.95
Magic and Kobold £99.95
Magic, Ease and Kobold £139.95

NB: Excellent with Calamus SL. Compatible with Notator Logic, but not with Notator SL and not yet compatible with Cubase.

PAK68/3

Turn your computer into a 32bit system the PAK68/3 using the 68030 processor. The 32MHz clock, 32bit wide TOS and a 32kbytes cache will accelerate your system by 775% (Gembench 3.10). This is faster than the Falcon and the TT! Clock speeds of 40 and 50Mhz are possible. The use of recycled processors makes this upgrade very affordable without sacrificing reliability.

A 32bit FastRam board and a colour graphic card adaptor are under development.

PAK68/3 board only, no CPU £249.00
PAK68/3, 33MHz CPU, TOS2.06 req. £299.00
PAK68/3, 33MHz CPU and TOS3.06 £359.00
PAK68/3, 33MHz CPU & FPU and TOS3.06 £399.00

ATARI

WORKSHOP

Kobold

This High Speed File Manager gives unbelievable speed. Copies 1000 files (10Mb) in 45sec (GEMDOS 5:35min!). Use Kobold for backing up; formatting floppies (DD,HD,ED); move, copy and delete files; use the learn function to automate repetitive jobs. Ease calls Kobold automatically for all desktop file and floppy operations. Run as ACC or PRG
Kobold 2.5 (RRP £59.95) Intro Price £49.95

Ease

Use your Atari with EASE. Replace the old Atari Desktop. This program could not be more appropriately named. Right click replaces the double click. Iconize windows for instant access to groups of files. Ease is aware of multitasking and comes with a sophisticated Colour Icon Editor. Works on any ST, all TOS versions, and with any display and graphic card.
Price £49.95

DeskTopper

No space for accelerators, TOS boards, hard disks, graphic cards and PC emulators? Convert your Atari into a desktop computer with more space. Simply replace your plastic top with the DeskTopper and fit your keyboard into FreeKeys (or replace with a PC Keyboard using AT-Key). For more information, ask for the DeskTopper leaflet.

DeskTopper - ST(FM/e)/Falcon £69.95
FreeKeys £39.95
AT-Key £49.95
Cherry Keyboard £29.95

T28 & T28e

Tired of waiting for your computer? Then speed it up with a 28MHz processor. The T28 accelerator is now available for STe and STFM computers. Compatible with Cubase and Notator Logic.

T28 - with 64Kb cache for STFM/MegaST £179.00
T28e - with 64Kb cache for STe £199.00

Coming soon: The MultiBoard, a TOS2.06 IDE and graphic adaptor with 2-8Mb memory expansion.

SCSI Drives

Best Hard Drive 1994 - ST Review Christmas '94
MiniS hard drives are full SCSI systems, hardware compatible with all Atari, Amiga, Mac and PC computers. They are unrivalled in size, low noise, speed, and style.
The ST(FM/e) version comes with The Translator and a FREE copy of HD-Driver Software. Please add £20.00 if you prefer the ICD Link II adaptor.

THE '95 PERCENTERS

Things are looking good for STE and Falcon games. To prove it, three games, already 95 per cent complete and due out in early '95, show off just what they're capable of.

STARDUST

PREVIEW

BY: BLOODHOUSE
 DISTRIBUTED BY: DAZE
 MARKETING
 MACHINES: 1MBYTE STE, FALCON
 PRICE: £25.99
 RELEASE DATE: IMMINENT

By now you've probably seen and played the Cover Disk demo of *Stardust*, the new shoot-'em-up from Bloodhouse of Finland. The game itself is an *Asteroids* clone with the graphics updated to take into account the wondrous nature of the STE's artistic capabilities. As with *Team* and *Obsession*, Bloodhouse's new game shows off just what the STE is capable of, and leaves you wondering why software

■ Why *Stardust* should feature a planet made entirely of biscuits is immaterial. You're under too much pressure to ask such questions anyway.

producers just haven't managed to get their acts together before now. It's mainly the independents like Bloodhouse that are showing a keen awareness of the machine

they're developing for and making the most of its enhanced abilities.

Stardust was a fast and ferocious shoot-'em-up on the Amiga, and even

OBSSESSION

PREVIEW

BY: UNIQUE DEVELOPMENTS
 SWEDEN (UDS)
 DISTRIBUTORS:
 MERLIN ☎ 01453 882793,
 JCA EUROPE ☎ 01734 452416
 MACHINES: 1MBYTE STE,
 TT, FALCON
 PRICE: £24.95
 RELEASE DATE: IMMINENT

When we first previewed *Obsession* back in issue 64, none of the missions had been added to the one table we played. More recently, UDS gave *ST FORMAT* an exclusive sneak preview of how the game is shaping up near to its completion, and it's looking damn good.

The three tables we've seen are Desert Run, Balls & Bats and Aquatic Adventure. Each comes with its own impressive soundtrack, and Balls & Bats even features crystal clear sampled speech.

Obsessed?

The bonuses and gameplay are based around the theme of the particular table you're playing. On Desert Run, for example, you have to travel between Paris and Dakkar. Each stage is completed by lighting up all the lamps to

spell 'pitstop', but to do that you need to fill your car up with gas, and before you can do that you have to collect money (in the form of Kronor). If that's not enough, there are also countless bonuses to collect.

The Balls & Bats table is where pinball meets baseball, your aim being to win the World Series. Aquatic Adventure, on the other hand, takes you under the sea in search of treasure (your obstacles including ferocious sharks and evil Captains). The final table, which we saw in the original preview is X-ile, and is set in the aftermath of a nuclear holocaust.

Looking good?

It sure is. The STE's enhanced capabilities have been put to good use; the tables are superbly detailed with lots of colour on screen. The animation and scrolling is super-smooth and, as with *Team*, overscan has been used to remove all those annoying borders and give up to 40 per cent extra screen space.

The soundtrack is superb, and varies with each table. The Balls & Bats table features

■ When you're living on the edge in a dark, dangerous post-atomic world, why not have a quiet game of *Obsession* to get away from it all? (He's not been well - Trent)

sampled speech of the highest quality, while the spot effects come across clearly and are easily distinguishable from the background tune. And the whole game is incredibly addictive. Just wait for the definitive review when it appears soon in *ST FORMAT* - *Obsession* looks like it's going to be well worth the long wait.

■ The Balls & Bats table manages to combine pinball with baseball for what must surely be the first (and possibly the last) time in world history.

■ *Stardust* revolutionises the concept of *Asteroids* in as much as it gives it a rather nice paint job.

scored 89% from Jon Nash in his review for *Amiga Power*. Once you've played our exclusive demo of one of the game's sub-levels you'll realise that the speed and smoothness of the Amiga version has been achieved on the STE too, using its blitter chip, hardware scrolling, 4096 colour palette and the rest.

What can you say?

Well, what can you say about a game that's *Asteroids* but with superlative graphics? Apart from the 3D sections that is. But in fact the programmers have obviously thought this through already and added a few extra aspects to the gameplay. For example, there are now different

kinds of boulders, some of which are easier to destroy than others.

From the second level on, the blighters have added monsters, obviously to remind you that in real life this much excitement is usually muted by a real feeling of fear. Oh, and there's lots of power-ups too. Play the demo and if the full game turns out to be as good as it looks, buy the game. Daze are on ☎ 0171 372 7435.

■ You can even mimic Luke Skywalker with our exclusive demo of *Stardust* on this month's Cover Disk.

TEAM

PREVIEW

BY: IMPACT SOFTWARE
MACHINES: 1MBYTE STE, TT, FALCON
PRICE: £24.95
RELEASE DATE: EARLY JANUARY (STE)

Team is yet another game that aims to demonstrate just how criminally under-used the STE has been used as a development machine. We featured an exclusive interview with the game's programmer, Ralph Lovesy, in last month's issue, where he rigorously demonstrated just how the game was going to use the STE's enhanced specs.

But *Team* is, first and foremost, a soccer game in the mould of *Kick Off* and *Sensible Soccer*. We've been flagging its technical specifications, such as its use of the blitter, overscan mode and 50KHz sound, but what does it all mean? Does it lead to the ultimate STE football game, or a complete turkey? You'll have to wait for the definitive *ST FORMAT* review of the full game to ascertain that, but in the meantime get all excited over the options *Team* promises.

Team Talk

Team is one or two player, with computer opponents of varying strengths depending on the team. The basic mechanics of the

■ Just look at that crowd, noisy and fully animated.

game are all there, including a realistic 3D environment which means that, unlike *Kick Off* and *Sensible Soccer*, you can't run through players, the corner flags or even the goal. So it's one thing chasing a player on the ball, but it's going to be something else dispossessing him of it.

Tackling from behind may seem like a valid option, but the game has been programmed with fully animated referees and linesmen, complete with red and yellow cards. The latest rules are all incorporated, including the backpass and offside rules, so watch out - a dodgy tackle could have disastrous consequences.

Managerial decisions

Just like *Sensible Soccer* and *Kick Off*, there are loads of options, enabling you to configure the game exactly to your personal requirements. The game comes complete with all the teams from the latest World Cup and English Premier League, and data disks will soon be available for other teams to be incorporated. Or you can create your own, complete with home and away strips, player colours and attributes. So look out for a Birmingham City XI soon.

■ Unlike *Sensible Soccer* and *Kick Off*, a one-on-one with the goalkeeper can easily lead to a goal in *Team*.

■ Even your goalkeeper can join in the action, so long as the opposition doesn't cotton on too quickly.

You can compete in a completely user-defined league or cup

competition, selecting whether extra time, replays, penalty shoot-outs or even away goals play a part. You can select your team to play any number of tactics and make up to five substitutions during the match (including your goalkeeper if need be).

Bruce Grobbelaar

There's plenty of room for inspiration in *Team*. Because of the realistic environment you could be cruising to a 1-0 victory when a speculative lob into your area cannons into your own net off the back of your defender. Even the goalkeeper is able to run halfway down the pitch (especially if he's just received a backpass) and score a spectacular solo effort. Then again, he might just get dispossessed outside his own area, and suddenly you're another goal down. Tsk.

The real test of *Team's* unpredictability, of course, is whether you can go 4-1 up with just 25 minutes remaining and still lose 6-4. But enough about Birmingham City's last season (they're doing much better this year anyway), contact Impact on ☎ 01280 850450 for the latest news.

View 2

Desktops. Hundreds of files sitting around, giving no clue as to what they contain.

Is it a picture file or a text file? There's no way of knowing. At least, there wasn't, until now.

As an ST user, you're used to dealing with a wide variety of files. But when you're manipulating these files through folders examining them becomes a hassle - you have to laboriously load up your whichever package they were created in every time.

FaST Club have come up with *View 2*, which helps with general file dealings. It opens just about every different type of file you use from day to day, so you don't have to mess about with something as bulky as an art package just to check what's sitting in a P12 file.

The manual gives you some idea of how powerful and versatile this package is before you've even loaded it up, skipping through text viewers, picture display utilities, digitised sound-files and animation-files as the four main types of files you can manipulate with ease. And the features don't stop there.

Nail files

To be effective *View 2* has to know just about every text format, every picture format, every sample style, and every animation system. Start throwing text-files at the package and you soon realise that it handles most formats. But then most text formats

are fundamentally identical, consisting of long strings of ASCII characters. *View 2* handles TXT, ASC, DOC and 1ST formats, and if you have a text-file that doesn't fit one of those standards then you're weird.

Picture formats are a different thing entirely. If you've ever spent an afternoon trying to process one picture you'll know picture formats are truly frustrating territory. No problem. *View 2* deals with P11-3, PC1-3, TNY, TN1-3, NEO, DOO, ART, SPU,

SPC and SPS. ST owners can also use the package to view STE pictures (something you couldn't normally do). And it deals with SEQ and DLT animation files happily, even if you don't have enough memory.

The sample viewer (or should that be listener) follows suit, dealing with a wide range of sound formats; AVR, WAV, SND, SPL and SAM files coast through your speakers at the click of a button.

The interfaces for viewing all these file types perform with far more grace than GEM could ever imagine. A text-file viewer that enables you to scroll backwards, flick pages and get to the end of a file without accidentally closing it? The other viewers work in the same way - not too complicated, just friendly and flexible.

The interfaces for viewing all these file types perform with far more grace than GEM could ever imagine

■ This is a stereogram, although I didn't know that until I'd double-clicked on it and *View 2* displayed it.

■ Alternatively, you can display text-files and use *View 2's* advanced display features to scroll gaily through them.

Something-else files

The success of *View 2* depends on other factors apart from its flexibility. Its front end and ease of use are also vital. But this is where it blows the competition clean away: it has no front end at all, and if you have a hard drive it doesn't even take up any memory. The system works by patching GEM, so that when you

double-click a file that isn't an application *View 2* boots up and displays the file, whichever format it's in, vanishing again when you've finished. It just tacks itself on to your desktop system. If you don't have a hard drive, *View 2* loads itself into memory at start-up and stays there, taking up a piffling 48K.

Rockford files

And then there are things like archive files. Archivers, although in practice an excellent idea, traditionally don't work. They're the kind of files that everybody seems to have a deep understanding of except you - no matter who you are. If you acted on our advice last month and took a stroll down the infobahn, you should now have a hard drive stuffed with LZH and ARC files, only half of which are ever likely to surrender their contents. The others will just crash or refuse to work. This isn't a fault with either archive systems, it's just the way computers work. They're complicated things and given half the chance they always go wrong.

View 2 can't guarantee the success of file transfer over a dodgy telephone line, but it can make damned sure that if a file's usable, you'll be able to extract what you want from it quickly and easily. *View 2* doesn't actually contain the necessary extraction code, but it calls up the appropriate extraction program (that you already own, hopefully) and tells it to get on with the job.

Chemical phials

What you have here is a program that kills one of the bigger problems with GEM. Instead of staring at icons and file names, unable to even guess at their contents, you can access any file type your ST throws at you. The closest thing to *View 2* so far is *GEM-View*, but *View 2* really can handle just about everything. Having failed to find any real fault with it I'll be making great use of it from now on. **stf**

■ Now just look at that. How are you supposed to know what any of these files might contain? Eight letters and a suffix doesn't exactly give a full description of what's in a file. System extensions are cool - huh ahuh huh huh. (Yyyeoss - Trent)

Art For Kids

It's an art package aimed at the chunk of the human race who're without the intelligence or awareness to get bored or realise they can't actually draw. One for Simon, then...

When I was little, I adamantly avoided anything that referred to me as a 'kid'. *Art For Kids* manages to get off on the wrong foot with its target audience straight away, then. At least, until the so-called target audience loads it up.

The package opens with a fanfare (first thing on a Monday morning too) and cheery balloons flying about the shop. From then on, things are really quite simple: a large blank screen bordered by tools, colours, palettes and options. The first thing that's apparent is that *A4K* works in

exactly the same way as every other decent art package, ever – it uses tools. Which means that immediately after loading *A4K* and enduring the bright, cheerful welcome, you can begin to draw immediately. Then stop in surprise.

You'd really expect a package called *Art For Kids* to be a normal art package but much lower quality and with a quarter of the features. *Art For Kids*, however, scares the hell out of your average half-dozed reviewer.

Bells and whistles

Everything has a sound effect. Clicking a key creates a beep, but that's dull. When you use the pen, you can hear it scratching on the paper, and when you use a stretch line, you actually hear it stretch. The sparkly brushes crackle as you use them, and the odd, geometric effects make alien noises as they go about their odd, alien business.

■ Although it's an art package, this is also capable of political cartoons, kids.

EDUTAINMENT

Yeah, yeah, it's one of those horrible, '90s phrases, but the educational qualities of a package like this have to be considered. Sure, it is only an art package for doodling, but things like doodling are encouraged in schools at an early age, despite the sheer volume of paint kids swallow daily.

If you have a young child, or you're working with SLD or MLD children, you'll find a package like this no end of help. For an art package it's novel in that the software actually makes noises corresponding to what's happening on screen. This

may just sound like a gimmick, but in teaching children textiles and the way materials interact with each other it should be an invaluable learning tool, drawing real parallels with physical drawing tools.

Children love to paint, and they love to have fun. Teaching them art with the aid of a piece of software that can keep a jaded writer (and a production editor – Jill) (and an editor – Trent) engrossed for a morning just trying out the different sound effects has to be a Good Thing. The more fun 'the kids' are having, the more they'll relax and learn.

■ Crow wasn't worried about being struck by lightning. "Pigs might fly," he said.

■ It's crammed with enough predrawn images to meet all your predrawn image needs.

When you fill an area, you can hear the paint pouring on to the paper, and when you decide you've made a mistake, the woman on the icon actually quietly mutters "oops" as you click on her.

I can't draw!

That's the other problem with kids – most of them can't draw. Now most of them probably can't draw to a level that they're quite happy with. The remainder, who can't draw even to their own satisfaction, are only going to find your average art package depressing. Tony Barker, author of *A4K*, obviously recognises this problem. There are a number of pre-drawn images that can be called up and worked with, as well as some component picture elements that can be stamped on to the kid's own drawings (leaves, balloons, trees, castles, flowers, and many others). Even the most incompetent, oafish, uncoordinated rug rat can use *Fuzzy Felt* to some degree.

But it's an art package, isn't it?

Well yes, and no. For an art package, it's a bad one – there's no Cut and Paste, no Copy, no Zoom, no Box effects (things like axis flipping can only be performed on the whole screen) and no comprehensive colour tools. Instead, there's a series of brushes to work in one of the 16 carefully-picked colours, pens, erasers, and fills. Oh, and the special effects. For special effects, they're not that useful, but they're a lot of fun – inverting, random patterns, checkerboard, patterning and many others can all work wonders on even the most boring image.

There's no Print option, either – but then, anyone with a printer will

have a copy of either *GEM-View* or *ImageCopy* anyway, and it'd really be a waste of time you bothering to use any other (or so Goodman International say, and I'm inclined to agree).

But despite this lack of conventional features, the whole thing, works excellently for kids. They don't want stippling effects, palette switching, graduated tints, anti-aliasing and a hundred other dull, pointless features; they want some bright, cheery paints, some simple but effective brushes, and entertainment, as well as a little help with their work. If you have a child between four and ten and they want to have fun on your ST, then you have a choice. You can either slap their wrists firmly and look down your nose at them, muttering something about "it's not a toy, you know" and have them grow up odd, or you can splash out £24.95 and have a normal, happy child that Santa Claus would approve of. **stf**

500MBytes of German PD and shareware for the ST, all on one CD. Can you handle it?

Where do you start with a CD like this? Tip number one: get a working knowledge of German, or alternatively a copy of a German-English translation program (look in the public sector) with German-English dictionary. Oh, and a CD-ROM drive would be more than handy (if you don't have one you can use a PC that has a CD-ROM drive to access the files, then copy them over).

These minor quibbles aside, the *STE Power CD Volume 1* cannot be disputed in terms of value for money. 500MBytes of PD and shareware programs for your ST would cost either hundreds of pounds in blank disks, or hundreds of pounds in phone bills downloading the equivalent amount from a BBS. If that wasn't enough, the fact that this is a CD packed with German software inevitably means

split between various program types. You'd be right in being suspicious of the large number of picture files enclosed, because they take up a huge chunk of the 500MBytes. However, the pictures are professionally drawn and, being GIFs and TIFFs, they have plenty of colours that even STE owners may get to see. Graphics aside, there are 120 MOD tunes created using *Tracker* programs (but they are, as ever, dance orientated).

And then there's the 'real' stuff: demos of commercial software, games, utilities, applications, Falcon-specific software and the like. About 50 per cent of the programs featured seem familiar, but there are plenty of others included that have probably never seen the light of day in this country before. One possible quibble is that the CD tries to be "all things to all men", so if you're only interested

■ The citadel loomed out at him from the screen. "Dodgy brickwork," Tarquin said, "and where's the atmosphere?"

DIGITAL VISION SYS.

STE Power CD Volume 1

that there are programs and data on it that you wouldn't otherwise be able to get easily over here. However, while 500MBytes may sound great in numerical terms, the phrase "quantity rather than quality" does tend to pop up in your mind.

CD or not CD?

You can see by examining the boxout just how the *Power CD's* contents are

in one aspect of your ST (such as desktop publishing, or music) then you won't get as much from it.

Nevertheless, if you have a CD-ROM drive, and you're looking for a rather fab all-round CD to run on it,

you don't need to look much further than the *Power CD*. Unless you're a mad xenophobe of course. The convenience of having everything supplied on one CD shouldn't be overlooked, and you never know - it may open up new areas of ST use that you've never thought of before for you to explore. **stf**

NICK PEERS

■ All sorts of useful programs are on the *Power CD*, such as *Procalc*. You'd be hard pushed to find nothing of value.

THE FULL LISTING

It would be all too easy to turn a review of a CD like this into a glorified list. Instead, here's a brief run-down of some of the ST and Falcon software that's featured on the CD:

Games

Comparatively few (50, in fact) games are featured on the disk. None seems to be particularly familiar, but the few that do stand out are German. While you may have problems deciphering the German, you're unlikely to have come across most of these beforehand. All sorts of games are catered for, from adventures to arcade via strategy games.

Demos

Plenty of German commercial software is featured here, only a few of which are well-known on these shores: *True Paint*, *Edhak 3*, *Studio Photo*, and *That's Address 2*. Of the others, most appear to be exclusive to continental Europe, so this CD provides your best hope of trying out software unlikely to be directly released into the UK.

Applications/Utilities

We'd be here all night trying to list this lot. Just regard yourself as picky if you couldn't find at least five programs you need among the mass of copiers, RAMdisks, replacement file selectors, memos and even astrology programs on offer. There are literally hundreds available.

Falcon

There are over 100 programs for the Falcon, including demos of commercial products (such as *Screenblaster*, which scored 85% last month), more frivolous demos, utilities (including three versions of *Backwards*), music and loads of graphic viewers.

Others

As mentioned in the main body text, there are also more than a few graphics and music files for the art-critic-cum-musicians among you.

£25 for a wad of programs that would cost you anything up to £500 separately. The words 'bargain' and 'veritable', not necessarily in that order, spring to mind.

X-Debug

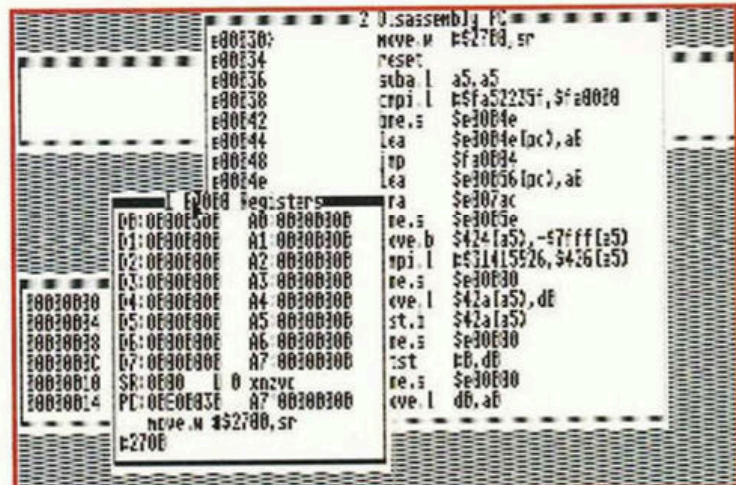

The Black Scorpions' new machine code debugger may be incredibly complicated, but we've got the experts in to make this review sound vaguely knowledgable and clever.

Okay – let's get one thing clear from the start. Machine code is not something you learn. Machine code is something you become, in a Zen kind of way. There are universities packed with eager beavers trying to gain ultimate power and wisdom, and they're missing the point entirely. Machine code is something that happens to you. Imagine a version of *Crossroads* (the film, idiot) with a boy who can play a mean assembler, if you like.

Probably the scariest task you can ever attempt is to interpret someone else's code. Your code may look very neat and structured when it's in your assembler, but it looks completely alien to everyone else, and as soon as it leaves your assembler it loses all notes, layout, and form. It becomes spaghetti.

But sometimes you've just got to get in there. You may need to work out how a particular trick works, or you may even be debugging some of your own code. Whatever you're doing, you'll need a powerful utility to give you every advantage in your quest. The Black Scorpions (sounds like a bad rock band) reckon *X-Debug* is the utility to help you.

X-Debug is, yes, a debugger. This means that once you've turned your assembly listing into a machine code program, you can use *X-Debug* to go through those numbers, work out what they mean, work out how they all fit together, and work out where

they go wrong. That's the idiot explanation. Now to concentrate on this review of a powerful debugger.

Debugge... No, I can't

That's right – *X-Debug* is a powerful package. It comprises a full disassembler, a full monitor, as well as a comprehensive breakpoint feature. The software takes the form of a full-screen set of windows, which happily

lend themselves to its many applications.

The first and most obvious thing *X-Debug* does is disassemble. Working with quick, efficient and well-presented lists of disassembled code,

X-Debug casts other disassemblers in shadow. Not only does it deal with a wide range of breakpoint structures, but it can intelligently handle conditional and trap comments. In short, it fills in all the gaps, from floating-point reference to backward working, without creating any extra hassle for the user (that's you).

Watch out for Black Scorpion's *BSS Debug*, a forthcoming contender. A comparative review in 1995, methinks.

Not only can you get things like register breakpoints but you can disassemble from that point. Schmart.

The real joy of this package is the fact that it works with a source-level debugger, meaning that you don't have to wait until your program is a string of unintelligible numbers before you can rip it to pieces. If you're using *Lattice C*, *HiSoft Basic* and the like you can get at your work using *X-Debug* as well, which, considering the kind of editing and testing features supplied by some compilers, is most definitely a godsend.

And, of course, there're the normal monitor functions, enabling you not only to watch over your running software, keeping an eye on registers, memory locations, program counters, buffers and the like, but also to slow it down or stop it, turn it around and see exactly what's going on.

Oh, Debugge... no, no

The first possible problem you encounter with *X-Debug* is the user interface. It casts aside the GEM system and goes for a totally new, home-made interface consisting of information windows and a command line. That's right – you type your commands in. Don't you remember things like that? There's a reason for this: programmers don't want to use menus, they don't want to slide windows about, and they most definitely don't want those horrible dialog boxes. Programmers can nearly all type quickly and accurately,

As you can see, the CLI interface is indeed an extensive one.

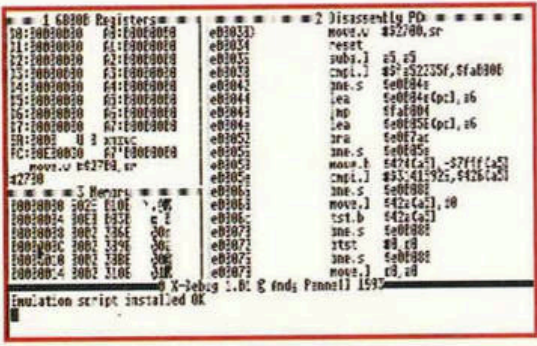

and you can say in one command what it takes four or five mouse clicks, window swaps, keypresses, accidental window closures and seven retries to put across with a GEM interface.

This is not a pretty program, but then the job it does isn't pretty. This is a package that's based on the same philosophy as *Protext*. Although it may not look like the best thing ever, the prettiness is exchanged for raw power. If you use *Protext* and don't mind a reduction in friendliness, you're going to get on just fine with *X-Debug*.

Having said that, the manual is pitched in a slightly different direction. The ins and outs of machine code and the relative merits of debugging it are ignored totally (quite right, too) in favour of *X-Debug* details. There is an extensive tutorial section, taking you through use of the package from step one. This is handy because there a lot of commands to learn, and if someone offers you help, you don't refuse.

X-Debug is a powerful package, carrying out most of the tasks you'd ask of it in the course of a coding session. If the authors were going in for 'incredible' as opposed to 'damned good', they'd have included a few extra options like a condensed memory map or a graphic viewer (for viewing chunks of memory as a graphic), but those kind of features are only needed once in a lifetime, so you can write your own. For now, rest safe in the knowledge that if you do write a condensed memory map utility, *X-Debug* will be an invaluable development tool. **stf**

PUBLIC SECTOR

GAMES

FRANTICK

GOODMAN PDL
DISK GD2357 (TWO DISKS)

Frantick is the latest release from Dave Munsie, the celebrated American programmer whose previous credits include *Kid Kong*, and *Kaboom!* It's a shoot-'em-up with a difference, in that your character remains in the centre of the screen blasting at aliens that attack from

both above and below. *Frantick* runs on any Atari ST, TT and Falcon and boasts improved features depending on the power of your machine, which means that STE owners get a slightly better game than their STFM counterparts, including compatibility with the Jaguar Powerpad controller.

The program is so large that it's best run from a hard drive to speed up the disk accesses. It's

touted as previewware, which means that you only get one life per game and play is restricted to the first 20 levels in easy mode. This, if anything, makes the game less playable, because you tend to die quite quickly, and must then sit through a sequence of disk accesses before you get another go.

Frantick itself certainly lives up to

He's back and he's mad. As Godzilla goes on the rampage, Nick 'Godzookie' Peers scours the public domain scene for more bargains.

■ *Frantick* on the Falcon. Spot the differences, if you can.

■ Mean Machine Trent gets blown away, while Cowardly Custard Nick hides in the corner.

its name, and it causes no end of 'psycho looks' from those of us who've played it so far (I think what Nick means is that he twitches a lot when playing it - Trent).

It's a highly playable little game, in a mindlessly violent sort of way, although it's hard to see how such a simple concept manages to take up so much disk space (even without any samples

loaded the game still requires 670K of disk space). It doesn't quite work as previewware. Because of the amount of time you wait between games you need more than one life, which is yet another extremely good reason for registering.

STF RATING: 73%

VIOLENT DEATH

TRANSPARENT DREAMS
DISK GAM 01

Written by Colin Watt in *STOS*, *Violent Death* is a *Scramble* clone, nothing more, nothing less. For those of you who don't know what *Scramble* is, like Jill, it's a horizontally scrolling shoot-'em-up, in which you fly through a cavern, bombing gun emplacements and blasting aliens and, oh everything. Two players can play at once and the controls are via the joystick, the only vaguely challenging bit being moving up or down while pressing <Fire> to launch a bomb. And the caverns can be agonisingly small at times. But it does provide a challenge, and two players should have fun combining their skills

instead of competing for a change. Love 'n' peace.

Smoothly scrolling, if a little functional in the graphics department, *Stellar Death* is a mildly enjoyable blast and once again shows that *STOS* is not that bad an engine for writing simple, sprite-based games as long as you're prepared to accept its limits.

STF RATING: 68%

■ Kill, maim, mutilate! Whoops, sounds like *Violent Death* has got to me a bit. I'd better go and lie down.

ZUFFERS

POWER PD
DISK PWR 480

This is a three-level demo (the full 30-level version is available for £2.50 shareware registration) for 1MByte STEs. It's a simple puzzle-up that might appeal to younger readers, in which the aim is to save the little Zuffers from death following the collision of a meteor with their planet. They've been dislodged from their shelters where they were hibernating, y'see, and your task is to move them back before the radiation kills them.

In real terms this means selecting each Zuffer in turn and sliding it back into its shelter before the time runs out. It's not as easy as it sounds, and is further complicated by the fact

■ This is *Zuffers*, and aren't they cute? Well, you'd better start thinking of them in that vein, because it's your job to save them. Okay?

that *Zuffers* tend to remain drawn in their original positions even after you've moved them, which makes it difficult to remember just who's been moved where. It's also difficult to see where the STE's extra capabilities have been used and why 1MByte of memory is needed. Nevertheless, *Zuffers* is fun in a severely limited kind of way.

STF RATING: 60%

MUSIC

SCOREWRITER

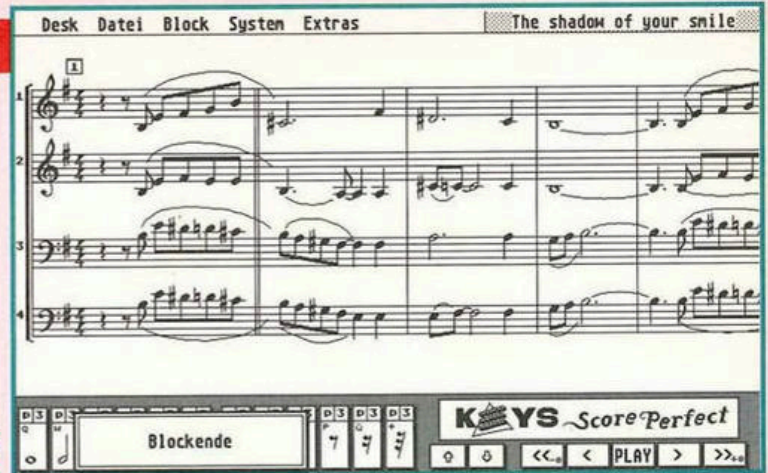

TUMBLEVANE PD, DISK MUM 63

There are a number of scorewriters in existence for the ST, but none works on colour displays. To fix that oversight comes this disk containing two European scorewriters, *1st Note 2.0* from Austria and *Score Perfect* from Germany, both of which work fine with a monochrome emulator on colour screens. Although an English helpfile is provided, you really need to print it out, because both programs work in German.

Both programs run fine with *Sebra* installed and are perfectly readable (although obviously not as clear as they would be on a dedicated monochrome monitor). The programs themselves do their jobs well, and if you're after a scorewriter you could do a lot worse than pay peanuts for these two programs. Another bargain from the public domain.

STF RATING: 76%

■ *Score Perfect* displaying one of the example files provided. Now why isn't there *Headlong* by Queen for goodness' sake?

STELLAR MODULE COLLECTION 11

STELLAR PD, DISK STEL 40

Six modules make up this latest collection of MOD files, but the they takes up so much disk space

(nearly 800K to be exact) that there isn't room for a MOD file player, like the excellent *CD Player*. But then, if you're buying a disk full of MOD files you either already have a file player or are entirely mad. The problem with this disk, like many of

its kind, is that all the tunes do is slowly build up one track after the other, in an incredibly repetitive manner. *Highway*, for example, has an atmospheric intro that would be great if it weren't for the fact that it lasts for over a minute, by which

time you've given up waiting for the music to start.

Nevertheless, four of the six tracks sound like some thought's gone into them, unlike the *Club Culture Mix Pack 2*. Not bad.

STF RATING: 65%

UTILITIES

AWARD MAKER PLUS

TUMBLEVANE PD, DISK UTA 028

Award Maker was first reviewed back in issue 54, and scored a highly reasonable 82%. This time the programmers have removed some of the bugs from the first version (including problems with the various borders used in creating certificates), and the whole thing works much better. Those of you lucky enough to possess colour printers can create colour awards

■ His complete inability to get over being dumped in last month's issue won Nick his first 'Bitter & Twisted' Award.

with as little fuss as boiling a kettle – the program is so simple to use that you can have your first awards out in no time at all. Over 200 award templates are provided, from history awards to sportsmanship certificates, each complete with its own little pictures, although you can easily create your own if you prefer.

Take a look at the screenshot on the left: it was created with the minimum of fuss and technical capability by filling in the gaps as prompted. The most difficult part of the whole process, apart from choosing which border best complements your award, is entering

the relevant code number depending on what award you require. It's therefore best to print out the program instructions in order to make selecting your chosen award template that much easier.

You can't go wrong with *Award Maker Plus*. It does its job professionally, comes with a wide range of printer drivers, and runs in both medium and high resolution for maximum compatibility. If you need a program for creating awards (and hey, doesn't everyone?) then you need look no further. If you don't, well get this program anyway.

STF RATING: 91%

ROUTE FINDER 2.0

THIS MONTH'S COVER DISK (SEE PAGE 6)

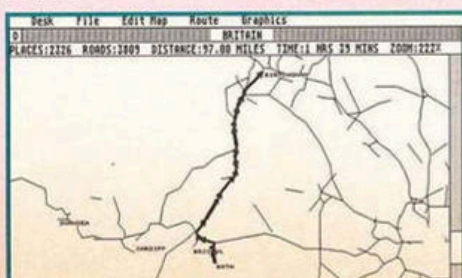

In what is obviously a complete coincidence *Route Finder 2.0* is not only reviewed in PD this month but it's also on this month's Cover Disk. This, somewhat worryingly, gives you the opportunity to try it out, read this review, and conclude that my opinions are in fact complete cobbles. Okay?

Route Finder has been reviewed twice before, scoring 78% and 84%. This time the author has added a graphical map, which enables you to zoom in and highlight more specific details about your journey (what towns you pass through, that sort of

thing). If you want to know how it works, turn to page 6 and the Cover Disk pages.

At the price of a floppy disk *Route Finder 2.0* comes cheaper than many road atlases, while trudging through the task of planning your journeys for you. Its database of place names isn't fully comprehensive by any means, but entering your own obscure village to the list is painless. Registered users get version 2.1 which comes even closer to the *FORMAT* Gold standard: you can zoom in or out to any area on the map, for example. Yet another excellent program from the public domain.

STF RATING: 86%

■ *Route Finder* – invaluable for planning journeys like, ooh, Bath to Birmingham to watch Bristol Rovers play Birm... (oh shut up! – Jill).

KOZMIC 4

GOODMANS PD, DISK GD2038

Kozmic 4 is a psychedelic pattern generator for all STs with more than 1MByte of memory. It assumes no artistic knowledge – just select the effect from those offered and you can quickly start building up a library of patterns. From there you can import them into any art package that supports Neochrome pictures (most support the .NEO file extension, including *Prism Paint* featured on Cover Disk 48). Or, if you're feeling particularly masochistic, you can build up your own migraine-inducing pattern slide show to play around with.

■ Oh dear, my brain hurts, my brain hurts. *Kozmic 4* is not recommended if you suffer migraines at all.

While *Kozmic* has a slick user interface, and does its job professionally, there isn't really any practical use for it, unless you particularly need a migraine for some work-related reason. But what the heck. It's fun, it works, and it's now free-ware. Get a copy.

STF RATING: 81%

DEMOS

THE ULTIMATE STE MEGADEMO

FLOPPYSHOP, DISK DEM 4229

Now if you read the reviews of the next two demos first, you might think I've been infected by the *ST FORMAT* "let's hate demos" virus. But

that's rubbish! This demo is proof that they can be used in a constructive way. The reasons this demo is better than the rest?

One, there is a level of interaction between user and demo. Two, you can select from a number of demos, and quit from each when you've seen enough. Three,

■ Gaze at those colours, feel the smooth animation, nod your head to the music and eat lots of vitamins (ah? - everyone else).

each demo shows off of the STE's colour and sonic capabilities without ramming thousands of messages down your throat.

Demo coders, you don't have to follow these

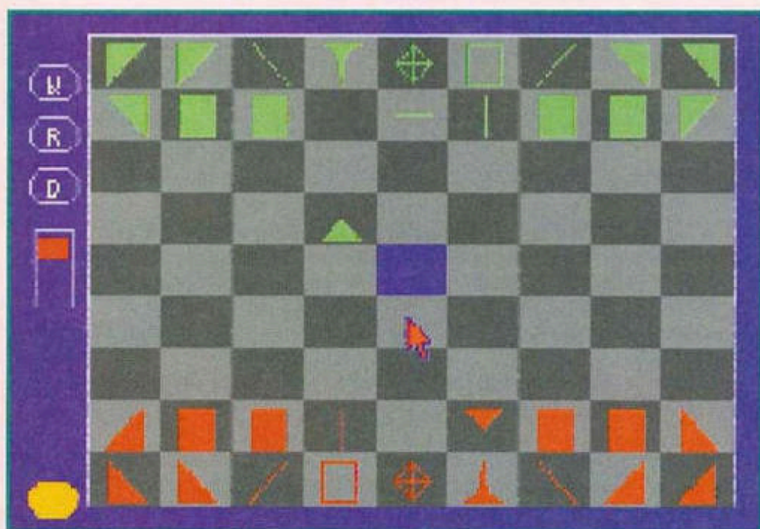

suggestions at all, but if you don't you'll end up with a demo like *Fly Over Fantasy* (below) which certainly does not entertain and enlighten in any way.

The Ultimate STE Megademo, however, is far more acceptable (there's even a decent tune in there somewhere). Okay?

STF RATING: 81%

■ You even get a game hidden somewhere with the *Ultimate STE Megademo*. No idea how it works, but still...

CLUB CULTURE MIX PACK 2 BY KUBA

STELLAR PD, DISK DEMO 077

Well, all the trademarks of the demo are here: thumping house

tunes and scrolly messages galore, but is there no room for innovation or anything that stands out from the crowd? Oh well, here goes then. *House Stompin'* encapsulates everything abhorrent in

dance music - the same old unchanging rhythm, with a few unchanging tracks laid over the top. Unfortunately, and probably somewhat predictably, the others are just more of the same. There's

nothing to recommend about this disk unless you happen to like listening to monotonous tunes. If you're a house fan you'll probably love it. Everyone else - avoid.

STF RATING: 51%

FLY OVER FANTASY

FLOPPYSHOP, DISK S-DEM 4225C/4226C

Look, a few pretty graphics punctuated by long minutes of boring scrolling messages sounds like a rip-off to me, okay? With no option to skip the boring bits you'd be better off watching paint dry. Demo

coders do themselves no favours with self-indulgent rubbish like this. After ten minutes of scrolling messages and only three proper pictures, and not even a remote sign of being asked to insert the second disk, I gave up, and I advise you not to bother even going that far. A complete waste of effort. **stf**

STF RATING: 25%

■ Right, you've seen the only decent picture in *Fly Over Fantasy*, so there's no need to buy the demo. No, absolutely none at all. Zilch. Get the message.

PD TOP TEN

This month Asgard Software get to show off their wares. Contact them on ☎ 01924 363059 for more details on any of the disks featured below or for general enquiries.

1. Route Finder 1.8
2. Alice Text Editor
3. Crack Art
4. FastCopy v3
5. PC Emulator
6. Medieval Chess
7. Skidpan
8. Treasures of the New Kingdom
9. Valgus 2
10. Certificate Maker

PD libraries! If you want your Top Ten featured here then for goodness sake send it in to us at: PD Sector, ST FORMAT, 30 Monmouth Street, Bath, Avon, BA1 2BW.

If you're interested in any of the programs here, the PD libraries' phone numbers and addresses can be found on page 71.

HARD DRIVES/RAMS

EXTERNAL HD'S

These high quality external 3.5" SCSI hard drives are built into a slim casing and come complete with a power supply unit, cables and software.

52MB HARD DRIVE	£179
130MB HARD DRIVE	£269
270MB HARD DRIVE	£349
540MB HARD DRIVE	£549

RAM BOARDS

We manufacture our own RAM boards for the Atari computer range, each one is subject to a stringent quality control procedure.

0.5MB RAM BOARD	£49.95
2MB RAM BOARD	£79.95
4MB RAM BOARD	£129.95
1MB SIMM	£35

MISCELLANEOUS

High quality peripherals for the Atari.

ATARI MOUSE	£15
OPTICAL MOUSE	£29.95
POWER CLOCK	£17.95
10 BRANDED DISKS	£5

RING INTERRUPTION

For use with the Ultimate Ripper and SuperMon. Stop games or programs in their tracks, search for infinite lives and hack with code, and with the press of a key the program is restarted.

RING INTERRUPTION	£15
-------------------	-----

POWER SCANNER

POWER SCANNER

The award winning scanner from Power Computing allows you to scan up to 400DPI in real-time greyscale, with autoscans and rate detect. The scanning software included allows you to edit and manipulate any image you scan.

POWER SCANNER	£99
---------------	-----

BLITZ TURBO

Back-up disks at lightning speeds, Blitz copies from the internal to the external drive and cleverly by-passes your ST's controller chip. In around 40 seconds you can back-up an ST disk, what's more you can switch between your disk drive and Blitz Turbo without disconnecting your Blitz interface. (1988 Copyright Act applies)

BLITZ TURBO	£15
-------------	-----

POWER DRIVES

POWER DRIVES

PC720B, the award winning external disk drive which includes a virus blocker, built-in Blitz Turbo and is able to boot from Drive B.

PC720B (INC.PSU)	£55
PC720P (INC.PSU)	£49.95
PC720I (INTERNAL)	£30
360K UPGRADE DRIVE, NEEDS CASE MOD.	
PC720OI (OFFICIAL)	£35
720K INTERNAL REPLACEMENT DRIVE	

DRIVE B CABLE

If you have an internal drive that is not compatible with 'boot from drive B', this cable will solve your problem.

DRIVE-B CABLE	£9.95
---------------	-------

SUPERMON

SUPERMON

SuperMon comes with all the features of the 'Ultimate Ripper' and more. Some of the features included with SuperMon are:

Features

- Program Switcher - allows programs to be in the memory simultaneously and switched between at the touch of a key.
- Printer Spooler - allows files to be printed at the same time as other tasks.
- Comprehensive Debugger - disassemble programs and step through them, intercept OS calls, search memory or find where a routine is called from automatically.
- Diagnostics function - check the internal functioning of your ST disk analyser, custom format disks, read/write, hide files.

Utilities

- The SuperMon also has many utility functions available, including reset proof RAM disk, mouse trap function, time display, screen snapshot and 50/60Hz toggle.

ULTIMATE RIPPER	£25
INC. SUPERMON	£35

Imagecopy

- Imagecopy 3.5 £29.95

- Copy images from screen in any ST/TT/Falcon video mode.
- Display images and slide shows in any ST/TT/Falcon video mode.
- Create halftone images to use with other programs (wordprocessors etc.)
- Convert images between different formats or to different colour types.
- Batch processing facility: convert or print batches of images.
- Extensive range of image formats. Imagecopy can read and write: Degas, GIF, IFF, IMG, JFIF (JPEG), PC Paintbrush (PCX), Prism Paint, RSC free image, Targa, TIFF, and Windows Bitmap. Other read-only formats include: Art Director, Calamus Raster Graphic, DR Doodle, Macpaint, Neochrome, OS/2 Bitmap, Pictor, Pixart, Portable Bitmap, Spectrum, Tiny, and True Paint, XGA.

++ Major New Features in Imagecopy 3.5

- Thumbnail option that displays miniatures of a set of images within a single window. This is useful for looking through a disk of images or for creating disk catalogues.
- Nine zoom levels plus the ability to flip and rotate images. Screen images can be automatically scaled to fit the screen.
- Faster colour processing: the colour saturation option is 20 times faster than previously.
- Slide Shows can be started with any image on a disk.
- Upgrades phone
- Imagecopy 3.5CD £34.95
Imagecopy 3.5 CD can load Photo CD images in any of the five standard resolutions: 128x192, 256x384, 512x768, 1024x1536, and 2048x3072 (memory permitting), and can also load blocks from any resolution, without having to load the complete image.

Buy Imagecopy 3.5 before the end of January 1995 and we will send you a free copy of Textstyle worth £19.95!

Perfect Printing in mono and colour

As well as being an excellent image management tool Imagecopy 3.5 has highly sophisticated easy-to-use printing features.

- Print pictures in black and white or colour on a wide range of printers: 9-pin, 24-pin, Stylus, Bubblejet, DeskJet, and LaserJet.
- Prints catalogue pages with up to 40 or more pictures on a single page.
- Full control over size, area, orientation, and position.
- Prints multiple copies - great for letterheads, invitations, labels, signs, posters, Christmas decorations, greeting cards, etc.
- Prints pictures with up to 16 million colours. Yes, as well as printing Amiga and PC pictures, you can even print photographs!
- Sophisticated colour settings ensures that you get the very best results from your printer. With Imagecopy 3.5 you can control: Primary Colour Strengths, Grey Balance, Blue Balance, Brightness (gamma correction), Contrast, and Saturation.
- Can be installed to print automatically with HyperPaint.

++ New printing features in Imagecopy 3.5

- Microwave printing reduces or eliminates banding on dot-matrix and bubblejet printers.
- Random print dithering option for better definition than halftoning.
- Enhanced printing facilities with a Print Density option for detailed control over print quality, Black Balance option for improved CMYK print quality on DeskJets, and a new 720-dpi Epson (Stylus Color) inkjet driver.

PD and Shareware

- 24-hour Catalogue Hotline
Phone 0115-945-5250 to request a copy of our latest 52-page A4 catalogue.

- FaST Club Catalogue Free

Probably the most comprehensive catalogue for the ST. Details on hundreds of PD and Shareware disks plus specifications of all of the products listed in this advert. PD Disks cost £1.25 each; or £1 for subscribers!

Great fonts

- Calamus Font Set #1 £8.95
 - Calamus Font Set #2 £8.95
 - PageStream Font Set £8.95
- 10 DS disks of PD and Shareware fonts in a box.

Christmas Bonus!

- Stocking Filler £FREE
Spend over £10 on goods using this advert (or a photocopy) as an order form and we will send you a free stocking filler worth at least £1.50.

Start Here!

- Starter Pack £6.95

If you have just started to use an Atari computer then this pack is just right for you. It contains a paint program, wordprocessor, spreadsheet, database, label printer, some essential utilities, and a selection of educational programs and games. All programs will work on a standard 520ST(E or FM) with a colour TV or monitor.

Save £5.00

- Int. ST Machine Code £14.95

Introducing ST Machine Code is an excellent book that takes the beginner step-by-step into the secrets of programming the ST in assembly language. The accompanying free disk contains a complete programming environment - there is no need to buy a separate assembler or resource kit! The book's 24 chapters introduce the gamut of ST applications programming from formatting a disk to constructing drop down menus and dialog boxes.

Textstyle

- Textstyle £19.95

Another cracking program from Jeremy Hughes, author of Imagecopy. Enter your text into Textstyle, select a Calamus or GEM font, add text effects and justification, and the resulting picture file can be imported into a whole range of packages. Great for generating headlines for wordprocessors like First Word Plus, Redacteur or Write ON; or use it with an art package such as PixArt or HyperPaint to make posters, banners, logos, greetings cards, etc. Thousands of applications.

- Textstyle £FREE!

Order Imagecopy 3.5 and we will send you a free copy of Textstyle!

ST Applications

For the last four years we have been publishing a monthly magazine for ST users. Full of informative and authoritative articles ST Applications is an essential read for all Atari users who are serious about getting the best out of their machine.

- 12-issues: £15.00
- 6-issues: £8.00
- 3-issues: £5.00
- Sample issue: £1.50

New lower prices!

Don't take our word for it, here are some unsolicited comments from happy readers: *unfailingly interesting, superbly written NWF, really excellent value GFS, invaluable service for ST users PS, consistently impressed AS, no hesitation in renewing my subscription PPK, you can read it again and again RF.* Originals of these letters available for inspection at our offices.

Photo2Disk

- Photo2Disk Info! FREE

For the same price as an enlargement we can transfer your photographs to disk so that you can use them in your art and DTP software.

£99.95 An ST for your PC!

- Gemulator £ 99.95
- Gemulator +TOS2.06 £139.95

Massive sales across Europe have pushed the cost of the Gemulator down to its lowest ever price. This stunning emulator allows ST software to be run on your IBM compatible PC. Needs a 386 or 486 PC with HDD, 4MB RAM, and one free expansion slot. For more details write or phone for a copy of our Gemulator InfoPack.

Save £10.00

- FastCopy PRO 1.2 £14.95

The best disk utility for Atari computers has just got better! FastCopy PRO features: highly efficient disk copying and formatting, creates and copies both extended format and MS DOS disks, fast hard disk backup with data-compression, built in disk editor and virus killer with virus immunization. Now fully Falcon compatible.

Le Price Cut! Save £54

- Redacteur 3.15 £45.00

In France Le Redacteur has sold over 10,000 copies and it is used extensively by several national newspapers.

Features:

- # Amazingly fast
- # Multiple rulers, paragraph styles and page layouts. Plus choice of character height/width and line spacing
- # Footnotes and endnotes
- # Automatic creation of tables
- # Pictures in documents
- # Programmable macros
- # Built in switcher for toggling between programs
- # Font Editor
- # Sigma equation editor for formulae
- # English and French spell checking plus verb conjugation
- # Editor for user-defined dictionaries
- # Automatic Hyphenation
- # Saves in ASCII, First Word (Plus), Word Perfect 4.5 and Microsoft Word
- # AZtheque database and Mail Merge
- # Comprehensive 650-page manual

Redacteur 3.15 runs in both mono and colour on any Atari ST or TT computer with at least one megabyte of memory. Send 75p for Demo disk.

Free Fonts. Order Redacteur 3.15 before January 31st 1995 and we will send you our Redacteur Fontpac Plus Set containing ten professional quality fonts completely free of charge.

Their Finest Missions

BATTLE OF BRITAIN DATA DISK

Become one of the few! You too can fly Stukas, bomb Dover, strafe Dorniers, scramble Spits, use Brylcreem, call your pals Ginger and snigger every time someone mentions bandits or bogies, with the new data disk for *Battle of Britain*.

Way back when, 44 years ago in fact, 'the few' of the RAF took on overwhelming odds (the Luftwaffe) in a battle for control of the skies of Europe. Armed only with guts, luck and a few flash planes they managed to see off the mightiest air force in the world. *Their Finest Hour*, released back in 1990, and later on budget in early 1994, told the story of these men. It enabled you to fly the missions that were to dictate the outcome of the entire war, and you could take either the German or Allied perspective.

Now a new disk of supplemental missions, cunningly named *Their Finest Missions*, is available, again at a knockdown price. But is it worth scrambling to the shops for? Offering *Their Finest Hour* veterans 23 new scenarios in which to get themselves killed, it appears to be good value, but it's quality that counts, not quantity.

De Javú

The biggest weakness of *Their Finest Missions* is hinted at in its title. The Battle Of Britain has already been fought, in *Their Finest Hour*. One of the most appealing aspects of *Their Finest Hour* was that you could play through the Battle Of Britain, taking the part of either the RAF or Luftwaffe, and your performance actually affected the outcome. This means that what you're left with in *Their Finest Missions* is a range of unrelated custom missions. Dead exciting custom missions, yes, but

they don't have any effect on the overall battle itself.

Now it may seem a little harsh to have a go at *Their Finest Hour* for not offering a new campaign. Realism was one of the original game's selling points after all, so it wouldn't be right to just run around inventing whole new aerial wars, surely? But the original program also came with its own mission designer, which is what was used to create some of the scenarios offering in *Their Finest Missions*. Hmm. Sure these are play-tested and polished scenarios, but you can't help thinking you could have done it all yourself.

Angles One Five

The missions – five Spitfire, four Hurricane, five BF109E, three BF110-C4, two Stuka, one Dornier, two HE111H-3 and one JU88A-1 – are a quality mix. It's a challenge just to be able to fly all eight planes well enough to even attempt most of these missions, because they were designed by Battle Of Britain aces.

The nature of the missions is refreshingly

■ Fly historically accurate planes, take on historically accurate missions...

■ ...and then die in historically accurate ways in historically accurate places.

Dagah, dagah, dagah.

Running on the same 3D engine (a pleasant hybrid of polygons and sprites) as *Their Finest Hour*, this is one of the better looking if not fastest flight simulations for the ST. The gameplay is similar, relying on flying skill rather than radar and proximity missiles for its kills, and that's good. It makes *Their Finest Missions* a real seat-of-the-pants affair. You have to be close to kill, go low to bomb and keep your finger by the trigger at all times.

This level of action combined with a strong element of realism is what made *Their Finest Hour* great, especially in campaign mode, but without the ongoing canvas of the war to play against *Their Finest Missions* is reduced to the status of a highly complex shoot-'em-up. Which isn't a bad thing, but it's not that compelling either. Most aces will examine all the missions and play many, but there's just no incentive to see them all through and complete the game. **stf**

TRENTON WEBB

■ Smithers-Jones never fully grasped the concept of runway approaches.

varied. One stacks up the entire RAF (well, 37 Hurricanes to be precise) against five BF109s and three JU88s. Another sets you the task of showboating a solo raid, which looks good on your bomb camera. The best, though, sets you the task of picking up a valuable spy from a runway at the RAF base at Tangmere. The trouble is that you're flying a Heinkel, and Tangmere is the home of a Spitfire squadron.

All 23 sorties are tough. It's assumed that seeing as you already have a copy of *Their Finest Hour: Battle Of Britain* then you've played it extensively. And there is the friendly option of having an experienced pilot for each plane, who's ready and willing to lend some weight to what can often be very one-sided battles. Just load them through the Select Custom Mission option and it's chocks away.

ZERO-

In 1961, man reached for the stars. In the early 21st century, when aliens casually announced their plans to take over the world, man reached for a clean change of underwear.

The battle for Earth has begun. We're not messing about this time. Those wars in the past – forget them. This one's big. Your planet is about to be wiped out. It's just waiting a few

extra seconds for one of the aliens who's still sitting on the coach eating his sandwiches.

In *Zero-5* it's your job (not as a lone crusader, just for a change, but as a member of DEFCON, Earth's defence force) to foil the evil plans of

the Morphons and save your planet from certain destruction. You're going to manage this by climbing into your filled vector fighter and rocketing off into the stars to fight other filled vector ships in a 3D space environment. At a basic level, *Zero-5*'s something like a flight sim, except that the ground's disappeared (mostly) and you're now equipped with a fierce gun.

You work your way through planets, comets, attack forces, defence carriers, hijackings, ambushes, and just about every other type of conflict a budding starfighter could hope for, in a blaze of green cannon fire streaking across the blackness of deep space.

Meathead with a mission
Drawing massively from the *Carrier Command* style, *Zero-5* plays as a series of different missions varying in complexity, difficulty and speed. You

work your way through as many missions as you need to, building a pilot database that logs your successes, failures and, most importantly, kills. Because you work through the missions in a rough logical order, the learning curve is

"You won't find a faster, more proficient or more enjoyable shoot-'em-up. This is *Elite 2* with balls"

matched exactly to you – if a mission's too difficult you can choose something a little less ambitious and work your way up from there. And although this does tie you down to a more structured game, you still have some choice of missions at each level of difficulty. This flexibility is certainly much better than coasting through seven levels of difficulty without a hassle only to find that you just can't get past level eight. *Zero-5* instead offers you another mission which, though just as difficult, may be a little more suited to you.

For the same reason you can also simply load up the game and, without a log of any kind, take on some of the toughest missions if you just want a quick blast on a

■ The drones are pack hunters. Even if you manage to shoot 20 of them down, you'll end up slamming into 40 more.

■ As you prepare to ram a ship twice your own size, your on-board computer gently breathes "danger" in your ear.

■ "Now I'm going to have to fall you on a few technical points."

■ I suppose in retrospect it was difficult to miss, but I was having trouble with the ship stores and... Oh well.

tough mission. Whatever, you can always find a mission that's perfectly suited to your playing style and level.

Guessing games

The mix between improvisation and script works well in *Zero-5*. Although each mission has a rough plot, and most events are planned, the environment is by no means linear and you don't tend find yourself in the same situation, confronted by the same enemy at the same time, as in other

games. This element of randomness works wonders for the gameplay.

And, of course...

We're talking about a 3D game here, and filled vectors are always tricky to code – if one plane slips slightly, exposing a few pixels that shouldn't

be seen, it turns into the electronic equivalent of a children's nativity scene. Effective 3D modelling comes down to programming in the end – anyone can produce a good spaceship, but few could write the software to

NARCISSISM

On a much more self-indulgent note, each pilot you create not only has a log, service record and medal collection, but a photo. There are no interesting pilot pictures provided but, inside the manual, you'll find a registration form to send back to Caspian. When you send this form

back, you have the option to include a photo of yourself, which Caspian will happily turn into a picture file and send back to you on a floppy disk. From this point on, you can create pilot records with your own photo. This is a game you can make a personal appearance in.

5

■ As the game progresses, the enemy forces get closer and closer to the planet Earth...

■ ...and proceed to fly around the planet until you turn them into pretty balls of white-hot hellfire.

drive it. The coding behind *Zero-5* keeps everything moving incredibly fluidly. It's a shame then that the ships lack the kind of attention to design shown in *Frontier*, instead owing more to the likes of *Starstrike*, although the sheer number of different ships lends a degree of variety.

Then there are the tunes that you get to kill the green scalyts. You would've thought a thrash metal band might be suitable (*you would? - Jill*) but *Zero-5* features rave music: an almost anthemic title tune followed by more atmospheric background music for the database. However,

after visual sequences that owe a lot to *Alien* the fast, loud, hyperactive rave tune spoils whatever atmosphere's been built up. Perhaps something vaguely orchestral might have been a better choice.

Play the game

On loading up *Zero-5* and jumping straight into the action there aren't too many drawbacks, but when you delve deeper you begin to find a few niggly problems. The first and biggest is disk swapping. The game comes as a program disk, a supplementary disk and a missions disk - an arrangement

that just doesn't seem to work to its best advantage, although to be fair fitting the game into 3MBytes must have been difficult. As soon as you try to access a pilot database you find yourself swapping disks to infinity with nothing to show for it. Cries of "But you just used that one" and "You want the supplementary disk again?" ring out as three tortured pieces of plastic and metal are shuffled between gradually tensing hands.

To combat this problem, *Zero-5* takes full advantage of whatever you have plugged into your machine. If you have two drives you can work with a disk in each, and if you have a hard drive you can install the game on to it easily. Single-drivers will just have to practise self-control, or modernise their system.

The next *Zero-5* problem is flight. The ship can be controlled with either a mouse or a Jag Powerpad (plugged into a normal machine) and the proper flight controls are observed, but slowing down isn't an option. You're travelling at a set speed and you can't change it. This can be a problem at times, and it means that the older, recognised *Elite* techniques of stalking, chasing, sitting and stunting aren't possible. Eventually, your combat turns into a series of fast dogfights rather than a strategic battle of wits. *Zero-5* is a fast-paced action-based game, but then, if you were to slow down and smell the roses, you might just realise there are no roses to smell...

A Smith & Wesson beats four aces

This is a game of fast action, accurate shooting and pleasing explosions, in which you can fly towards someone at massive speeds, searching them out with your laser. You actually feel your sights inch closer to the target, and get the thrill of hunting your

enemy without ever actually having to stop and think, or spend any time waiting for them to fall into your trap. Tactics are still important, and you do need to learn to survive, but the skills you need aren't business sense and luck. You're being paid to fly around and smash things up.

The graphics reflect this. If you hang around a group of alien ships delicately pulling off the stragglers you'll feel pleased with yourself, but charge straight at them, filling their slimy faces with green laser

death, and your screen becomes awash with flame, as yet more of the alien scum bite the big one.

Caspian Software are excited about this game for a reason. You won't find a faster, more proficient or more enjoyable shoot-'em-up on the ST. They've taken the gameplay of *R-Type* and combined it with the polish of *Knights of the Sky* (top MicroProse flight sim action), to produce a good balance between fast action and longevity. Its only real shortcoming is the limited number of missions, but Caspian will be releasing extra mission disks in future. This game really is *Elite 2* with balls, and you should buy it right now. It's the best 3D space shoot-out ever! **stf**

SIMON FORRESTER

GENTLE INTRODUCTIONS

When we interviewed Andrew Gisby, *Zero-5's* author, back in issue 64 he told us he'd spent a lot of time getting the game to feel cinematically right. The game was inspired by *The Last Starfighter*, and references it most gratifyingly throughout. The best example of this is the introduction. It's unusual to see floppy games with lengthy intro sequences (although cart games are full of 'em), but *Zero-5* has the full works, starting with a visual and audio sequence that, although not technically mind-blowing, screams of time, effort and sheer professionalism.

Still shots of the pre-game action don't really do much justice, but suffice to say that it explains the plot using a series of stills accompanied by soundbites, backed atmospherically with what Kubrick would describe as self-conscious breath, making the

■ The battle for Earth has begun. Looks damned good, as well.

perfect introduction to a great game. At a later stage in the pre-game options you find another database, this time giving the full story as to exactly how Earth got into the trouble it's in at the moment. The story runs roughly along the lines of a probe being sent into the innermost reaches of the galaxy, and receiving organised, electromagnetic signals from a non-human race. Six years after the Earth probe sent its own signals, the aliens replied, with a trite message to the effect of: "Oh. Right. We'd better take over that planet, then, hadn't we? Oh, go on." Earth is in big trouble...

■ *Zero-5's* biblia database, chronicling the decade of the brown trousers.

■ Your mothership, piled high with fuel, equipment and a really serious amount of heavy weaponry.

ST ANSWERS

ST FORMAT's own infobahn warrior, Clive Parker, tackles your problems, ranging from printer drivers to the *really* ridiculous.

Starball problems

DISKS I'm having trouble with running *Starball* from the ST FORMAT Cover Disk 64 – the game always bombs out. When I unpack the file I get a message saying that the data is damaged. Please put a fixed version on your next Cover Disk.
Rafay Qadin, London

A It sounds like you have a faulty Cover Disk. With such a large number of disks duplicated every month one or two are bound to be faulty. Just send your faulty disk to: ST FORMAT November Disk Returns, PO Box 21, Daventry NN1 5BU with a padded self-addressed envelope (no need for a stamp on it) and a note explaining that you need a replacement disk. Full instructions for disk

problems are included on the Cover Disk pages every month.

DIY floppy

HARDWARE Can I build an external floppy drive using the internal drive from a broken STF? What parts do I need and where can I get them?
Marco Spelde, Almere, Holland

A You could possibly build an external drive using an old internal device, although it would probably work out less expensive to buy a new external drive. You need a suitable case, an internal regulated power supply unit and a 14-pin DIN-to-Shuggart cable. We're planning a feature on building an external floppy drive in ST FORMAT soon.

It's just as cheap – if not cheaper – to buy a new external drive as it is to build one from spare parts like some demented mad scientist (with a fetish for joystick leads).

Starball on Cover Disk 64. Nick, Simon and Trent have hardly done any work this month, yet again, because they've been playing it so much.

Radio ham

SOFTWARE I am interested in using packet radio with my STE. Is there any software available to do this?
Paul Brooks, Downham Market, Norfolk

A Indeed there is Paul. There are no commercial packet radio programs that I am aware of but there are several useful PD programs you can use. Worli is a program designed to enable you to run a packet radio bulletin board complete with 150K manual, while Packet is a comprehensive general purpose packet radio program. Call one of the PD libraries listed in our ST Directory (page 71) and tell them exactly what you need – they'll be glad to help you

out. Make sure you remember that most packet radio software only runs in high resolution.

The plot thickens

PRINTERS I have a Hewlett Packard plotter, model 7221b. Can I link it to my STE and what software can I use with it? Can I use a standard art package?
Steven Good, Cramlington, Northumberland

A Almost all plotters use a standard parallel Centronics interface, so you can connect it to your STE using a normal printer lead. Your problem lies with software. Plotters are designed to be used with CAD (computer aided design) software that

STOS CORNER

Frank Charlton fires up his steam-powered Internet relay and shows you how to extend yourself.

Extension help

With some help from a few friends I'm busy writing a new STOS extension, which I want to release into the public domain. We have about 80 new commands in the interpreter version of the extension, but we're starting to have problems with the compiler version. My friend's pen-pal told him that we couldn't have that many commands in the compiler extension, but didn't tell us why. What do we do?
Jeremy Caudle, Palmersville

Because of differences in the way STOS handles interpreter and compiler extensions you're limited to using 64 commands in a compiler version, even though you can

use up to 128 in each interpreter extension. For large extensions like the one you're writing, you need to follow the route used by the programmers of *The Missing Link*.

If you look at the way *The Missing Link* gets around the problem, you'll notice that it splits the extension into two separate files, each with 64 commands in. Effectively, you need to write two extensions. Actually, the registered version of *The Missing Link* needs three parts to hold all of the commands. Good luck with the extension, and I'd love to see it when it's done.

Internet connected!

I thought you might like to know that STOS programmers with access to the Internet can join a special mailing list to swap hints and tips, as well as find answers to difficult STOS questions. If anyone would like more information about the list, they can send

me an e-mail message at the address ma2ljg@midge.bath.ac.uk and I'll send them info about it.

Les Greenhalgh, Bath

Thanks, Les. If you use the Internet and want to keep in touch with the latest STOS news and developments, this is the thing for you. When you join the list, any messages sent to it are forwarded to your mailbox. Because everyone that reads it is a STOS user or programmer, you can guarantee that your query or tip will get an answer. You'll also find out where the latest STOS-related files are available for download. Les runs an excellent service, and best of all – it's free.

Incidentally, you can also contact me on the STOS mailing list, or send electronic mail directly to me at frank@theshack.demon.co.uk if you have any questions or feedback for the ST FORMAT STOS Corner. If you want

SOUND

MUSIC AND MIDI

Andy Curtis boldly goes where many people have gone before. Crazy, but mostly coherent.

Cubase upgrade?

I have heard that there is a new version of Cubase out for the ST but I have received no notification about it from Steinberg. I am a little confused as to what is really going on so I would be grateful if you could sort it out for me. Thanks in advance.

Graham Dunwald, Essex

The latest version of Cubase is called Cubase Score and it has been out for a little while now. It is available either as a new package or as an upgrade to Cubase version 3. The addendum package costs £59 from Harman Audio (☎ 0181 207 5050). The new score edit page is greatly enhanced with advanced score styling and printout facilities. There are also upgrades to the core program, including an arpeggiator and some cosmetic changes. In short, if you are serious about score editing and printing then you will want to upgrade.

I'm going MAD...

At first it was merely a little irritating, then it began to annoy me. At present it is driving me mad. Please help. I use the Breakthru sequencer by Software Technology, and each time I load it, instead of going straight to the main screen, a large dialog box pops up telling me that I have used no memory and that Software Technology produced the program.

I then have to click the mouse to get rid of it. I KNOW THESE THINGS ALREADY! Why do I have to have them rammed down my throat each time I load

the program? I pay shareware authors to have intro screens like this removed. Is it too much to ask that a software company should not treat their customers like unregistered shareware users?

Infuriated, Croydon

Whilst we can understand that this may be a feature that does not suit everyone, surely it is a small price to pay for the use of a wonderful program? Here are three ways to combat the problem:

1. Leave the sequencer running all the time so that you rarely have to launch the program.
2. Ask a friend or relative to launch Breakthru for you, thus sparing you the frustration.
3. Get a life.

Loop the loop

I use Cubase Lite and have found it to be a capable package. I miss a feature that I used to use in my old sequencer, however. The loop facility enabled me to make the drum part continuous so that I could try out ideas. There seems to be no facility to do this in Cubase Lite. Do I have to upgrade to Cubase, or am I missing something in the manual?

T R Devonshire, Dewsbury

Unfortunately there is not a conventional loop facility as such in Cubase. This actually applies to Cubase Lite as well as to Cubase itself. The easiest way to get round this is to use the Repeat function, which enables you to repeat a part as many times as you wish. Then you simply set the sequencer going and record away to your heart's content. Make sure that the part or parts are highlighted first and then select the Repeat command

from the Structure drop-down menu. All you have to do is enter the number of repeats desired and specify whether or not they are to be 'Ghost' parts. If you use 'Ghost' parts then any changes made to the original will affect all the repeated parts as well - handy if you are experimenting with different ideas.

Quantising hell

Having used a sequencer for some time now, I must confess that I still have not fully comprehended the full implications of the quantising process. Whenever I attempt to quantise a part it ends up sounding 'wrong' as opposed to 'correct'. How can I guard against this?

Bill Geddes, Durham

The most important thing to remember about the quantising process is that it can only do what you tell it to. It is not a magic wand that can be waved over errant performances making them correct.

First you need to decide what the shortest note is in your part. This simple chart may help.

Crotchet = 4 beats to a bar = 1/4
Quaver = 8 beats to a bar = 1/8
Semi-quaver = 16 beats to a bar = 1/16

Now you need to select a quantise function that is the same as your shortest note. This will ensure that no notes are stacked on top of each other by the quantise. If most of your part is in quavers and crotchets apart from a little flourish at the end then load the part into an Edit page and quantise the rest of it using an 8 value, but leave your clever bit intact. This can be highly effective and most sequencers support a feature like this.

outputs the specific commands needed to control the pens in a plotter. Normal ST art packages are not supplied with plotter drivers alongside their printer drivers. The only CAD program currently available for the ST is GFA Draft from GFA Data Media - give them a ring on ☎ 01734 794941 for the current price.

Atari PC monitor

I've been offered an Atari monitor for £20, model number PCM124. Will I be able to connect this monitor to my 1MByte STE?

Tony Friend, Maldon, Essex

The monitor you've been offered is a 12-inch mono monitor for the Atari range of PC compatibles that they produced in the late 1980s. While the basic internal components of the PCM124 monitor are identical to the SM124 for the ST, the connections are different. The PCM124 has a PC-style 'D' connector instead of an Atari 13-pin DIN connector, which means that you can't plug it into your ST.

Take the monitor and your STE to a local computer or TV store along with your STE manual, and they will replace the PC plug with a 13-pin DIN plug using the pinout charts at the back of the manual.

No TOS disks

I've had my STFM for about four years and I want to do some printing with my Star LC-10 printer. The problem is that I haven't got my original TOS disks. Where can I get replacement disks?

G S Richmond, Walney Island, Barrow-in-Furness

This isn't as big a problem as you think because you don't need the disks that come with an ST to do any printing. If you want to print anything from within a word processor, or any other program for that matter, you simply select the Star

LC-10 printer driver from within the program you are using.

Printing with your ST doesn't use any external software, because all the printer drivers that you're going to need are stored within your software and within the TOS ROMs inside your ST. So get your word processor loaded and get printing.

Monitoring the system

I have a 1MByte STFM and I am wondering if I can use my Tatung TM01 monitor with it. If I can use it, can I use it in high-resolution mode?

GE Cawdron, Balby, Doncaster

to know more about the Internet and what it is, check out our feature in ST FORMAT 65 - turn straight to page 85 if you missed it.

Yeah, but what is it?

I've just started using STOS and I've been reading in your column about things called extensions - can you tell me what they are, and give me a list of which extensions I can get?

Alan Keene, Bristol

An extension is literally what it sounds like - a way of extending STOS itself to give you more commands and features to use. Your copy of STOS should have one supplied with it, the Picture Compactor - check your manual for details on how to use it. Commercially released extensions are difficult to find now, but here's a list.

STOS Compiler: Turns your BASIC programs into faster machine code, and means you can produce standalone double-clickable programs which run from the Desktop. You really should try to get hold of a copy of this.

STOS Maestro: Comes in two versions. Maestro gives you the commands needed to use sampled sound and music in your programs, and Maestro Plus comes with a sampling cartridge so that you can make your own sounds.

STOS 3D: Provides you with commands to create and animate filled 3D vector graphics in your games. 3D is slightly slow and unwieldy, and never really took off with programmers although it's good for beginners.

As for PD and shareware extensions, you're spoilt for choice. We don't have enough space to go into each one in detail, but the those you should look out for are: Misty,

The Missing Link, STOS Extra, STOS Tracker, STOS Control and the forthcoming Eagle extension, which looks promising - more next issue. Goodman have a great selection of STOS extensions, tutorials and example source files, call them on ☎ 01782 335650 or e-mail them on mgoodman@goody.co.uk.

And finally...

Here's a little tip which came in through the Internet STOS Mailing List from Andrei Ellman at ae-a@minster.york.ac.uk.

If you want to use the regular ST keyclick instead of the STOS keyclick, do the following.

click off : poke \$484,15

This is useful if you don't want your program to have that 'written in STOS' feeling.

A You should be able to connect your ST and Tatum monitor together. Call Meedmore on 0151 521 2202 with details of your ST and the model number of the monitor. They can make you a lead to order for around £15 – it depends on the price of the parts.

You will only be able to use the monitor in low or medium resolution if it is CGA compatible, but if it is VGA compatible then you'll be able to use high resolution mode.

System disks

SOFTWARE I recently repaired a 520STFM for someone who then refused to pay me, so I now have a shiny old STFM! The problem is that all of the start-up disks have been damaged and I don't have any documentation. Instead of scrapping the machine I went out and bought ST FORMAT with the idea of obtaining a new system disk like DOS on my PC – I presume it's STOS on the ST? Where can I learn more about the ST and where can I get a system disk?

John Sayer, Canvey Island, Essex

A You don't need any system disks for your machine. The ST is completely unlike the PC because the system software is built into the hardware of the machine in the TOS ROMs, which means you don't have to hang around waiting for the system to load from floppy or hard drive. You just switch it on, slot a disk in the drive and BAM! The system is loaded.

The GEM operating system is similar to Windows but a hell of a lot faster and easier to use. Don't look for a CLI (command line interface) because there isn't one. To copy a file you just drag it from one window to another, and to delete it you just drag it to the dustbin. Easy peasy.

To find out more about using your ST and how to get the most from

■ Ooer, it's a Falcon disguised as a professional piece of music kit. Which of course it is, it's just less intimidating to musos.

■ The future of the Hawk is under discussion at the moment. If it doesn't make it out, at least there's always the good old Falcon.

it just get ST FORMAT. STs are surprisingly powerful machines, y'know.

Memory upgrading

HARDWARE I want to upgrade my ST to 2MBytes from 512K. My video shifter chip is soldered on to the motherboard – can I do the upgrade myself or do I need help?

Shaun Collorick, Minehead

A It depends how good you are with a soldering iron. I don't recommend soldering to chips inside your ST unless you are really experienced with handling electronic components and using a soldering iron. Get help, call COMPO Software on 01487 773582 and ask for details of their memory upgrade service – they can arrange for courier collection and return of your ST.

Which ST?

HARDWARE I have been buying ST FORMAT since the Quartet issue to help me

decide which second-hand ST I should buy for making music, both recorded and live. I have six quick questions for you:

1. Should I get an STFM or an STE?
2. What is the minimum memory I should get?
3. I have used Cubase. What software would you recommend I use for sequencing?
4. Do I need Replay 16?
5. What type of resolution monitor do I need?
6. Does anyone make rack mountings for STs?

A Basire, Walthamstow, London E17

A E17? Walthamstow? I just hope that you don't dress like all those other idiots from your neck of the woods. Right, to answer the queries in order...

1. You should get an STE with at least TOS 1.62 installed. You can always get a TOS 2.06 upgrade later.
2. The minimum memory you should have in your STE for any serious application is 1MByte. I recommend you upgrade to at least 2MBytes for serious

work, and 4MBytes is usually regarded as the norm for music applications.

3. You said it! Cubase 3 is the bee's knees when it comes to sequencing.
4. Replay 16 is handy if you want to include samples as part of your musical compositions or for creating sample files for Quartet. If you want to use samples with Cubase you'll have to use a MIDI keyboard or module that enables samples to be imported from your ST.
5. High resolution, without a doubt. All serious music software uses high resolution only.
6. Yes, contact Digital Village on 0181 440 3440. They already mount Falcons in 19-inch rack cases in 2 U high units called the Hawk, and they are thinking of offering the same facility for STs.

And again

HARDWARE I have an STFM with a Marpet 2.5MByte expansion and TOS 1.2. As this setup is quite common I'm upset that more and more programs seem to crash with an odd address error yet the same software runs okay on an STE. I am having problems with Cannon Fodder (crashes on level five) and Notator Logic (crashes on the score page). Is this problem caused by the memory upgrade or by TOS 1.2?

Derek Johnston, Belfast

A Your problem almost certainly lies with your version of the operating system. TOS 1.2 is probably the most incompatible version of TOS and causes all sorts of problems with software and hardware such as hard drives. Your best bet is to get a TOS switcher and use TOS 2.06 for most software. Try the solderless Amitar TOS Switcher from Analogic Computers for £59.95, that should solve your problems. Call Analogic on 0181 546 9575, and if you are

PROGRAMMING GFA WORKSHOP

Mac Marsden randomises his brain every 27 seconds, day or night.

Lost files?

I have been programming in GFA Basic using version 3.5 from from Cover Disk 35. I have a problem because I only have GFA Compiler v2.0, so I cannot use AutoZeST in my compiled programs. I do have GFA Compiler v3.0 but it doesn't work. Do you think some files are missing? These are the files I have on my GFA Compiler 3 disk: GFA3BLIB, GFA3BLIB.NDX, GFA_BCOM.PRG, GL.PRG. Please tell me which files are missing.

Wim Haanstra, Zwolle, Holland

There are some files missing from your GFA Compiler 3 disk, most notably the MENU.PRG. Return your disk to the supplier and ask for a replacement, or contact your local distributor of GFA software – they should be able to replace your disk for you.

Folder contents

How can I display the whole directory of a disk including the contents of folders? I have tried using the DIR command but I haven't had any luck at all.

D Stokes, Colchester, Essex

There are two commands that enable you to look at the contents of a disk:

```
DIR "A:\*.*"
```

and

```
FILES "A:\*.*"
```

The DIR command only displays the contents of a directory and does not include any files held within the folder in that directory. Also, only the file names are displayed

The FILES command displays all information about a file – length, time and date – and displays any folders in a directory, identified by a * prefix. It's important to

remember that if you use FILES "A:*", the wildcard *.* is added automatically. Using FILES "A:*.*" TO "B:\ST\CONTENTS.TXT" does not display the listing, but writes it to a file on Drive B called CONTENTS.TXT in the directory called ST. You are also able to pipe the listing straight to your printer by using the command FILES "A:*.*" TO "PRN:"

It's not possible to list all the contents of the main directory and the sub-directories using a single command. Use the following lines of code to read the root directory and then the first level of sub-directories.

```
FILES "A:\*.*"  
FILES "A:\*.*\*.*"
```

Data restoration

Is there any way I can re-use data held in data statements? When I try I get an error message saying: "Out of data."

Joseph Black, Lyme Regis, Dorset

wary of installing the switcher yourself they offer a courier service.

Memory again

HARDWARE I have an Atari 1040STE with 1MByte of memory. If I get a 2MByte upgrade does that mean I will then have 3MBytes – the 1MByte I had plus two more? Or will I just be adding 1MByte when buying 2MBytes for about £50?

Lloyd Hannis, Coventry, West Midlands

A Sorry to disappoint you Lloyd, but you'll only end up with 2MBytes of RAM. This is because the 1MByte of RAM inside your STE is made up of four 256K SIMM memory boards, and you have to remove them before you add any 1MByte SIMMs because you can't mix 1MByte and 256K SIMMs in an STE. You can always sell the 256K boards in the reader ads pages – turn to page 66 to fill in the form. You should get about £5 each for the 256K SIMMs, which should offset the cost of upgrading your STE to 2MBytes.

Ooh, I can't decide

HARD DRIVES I'm stumped. I want to buy a 170MByte hard drive for my STFm but I don't know which one to get. They all seem to be priced at around £299. Which hard drive would you recommend I go for?

David Pomeroy, Bexley Heath

A After trying out many hard drives over the years I think I'll have to recommend the MiniS drive from System Solutions (☎ 01753 832212) because of their brilliant record of customer service and product support. Hard drive prices change all the time, so give them a call to get the current price.

Oh my good gawd!

SOFTWARE I'm having trouble loading games and programs into my computer. Each time I try I get the following message: "Lack of internal memory, insert program 100." Can you help? Maudeep S Rai, Dovecotes, Wolverhampton

■ The MiniS hard drive from System Solutions. It looks good, it tastes good and by golly it does you good.

A Eh? What? That's a new one on me. I've never come across that message before in over seven years of ardent ST use. None of my tech manuals even hint at this error message. This may seem like a stupid question, but have you got an Atari ST? If you have then it sounds like a memory problem.

If you have an STE then you could try opening it up and making sure that the SIMMs are all seated in their sockets correctly. If this doesn't solve the problem, or if you have an STFm, then I'm afraid you're going to have to contact a repair centre.

Contact Fast Atari Repairs on ☎ 0171 252 3553 – they perform repairs for £44 and offer a collection service for £5.

Incompatible?

HARD DRIVES I'm having problems booting my Mega ST's ICD hard drive when using TOS 2.06 on a T-Board 64. All I get is two bombs after the Atari logo, yet the hard drive boots up fine in TOS 1.2 mode. I'm booting with the T-Board system disk in the floppy drive.

George Smith, Durham

A You need to copy the T-Board 64 software to your hard drive when you have booted in TOS 1.2 mode. I see from your list that it isn't installed on your hard drive. If you copy the software to the drive you shouldn't have any more problems when you re-boot into TOS 2.06 without the T-Board 64 system disk in the floppy drive. If you still have problems then contact the COMPO helpline number in your T-Board manual.

Double trouble

PRINTERS I'm having trouble with my new Star LC24-30 printer and 1st Word Plus. Whenever I print I get errors in the hard copy with some letters being printed twice. If I reprint the document I get the same problem but in different words! My old 9-pin printer worked fine.

Nigel Natrass, Stapleford, Nottingham

A Your problem is probably caused by the printer driver you are using in 1st Word Plus. First make sure that you have set your Star printer to Epson mode using the dip-switches – see the printer manual to check which switch you have to change. Now try all the 24-pin Epson printer drivers supplied with 1st Word Plus one by one until you get a perfect printout. If this still doesn't work then contact a PD library and ask them if

they have a disk of 24-pin printer drivers for 1st Word Plus. It's a common problem and most libraries will be able to help you out.

Bubblejet drivers

PRINTERS I've been given a Canon BJ-10sx bubblejet printer. Canon have told me that it's compatible with the ST and have kindly sent me a disk with Atari GDOS drivers for the Canon BJ-10. The problem is that I have TOS in my ST, not GDOS, and Canon have told me that they don't have a driver for TOS. What can I do?

DI Rowle, Lytham, Lancashire

A It's simple. Ignore the GDOS printer drivers disk – you don't need it for most ST programs. Open the front panel of your Canon BJ-10sx and look at the dipswitch settings, described on the inside of the panel. Open the dipswitch panel on top of the printer and flip the relevant dipswitch from Canon mode to Epson emulation mode. Now just select Epson 24-pin printer drivers from within any software you use. Don't worry that your printer is a bubblejet and not a dot matrix printer – it works because the BJ-10sx has the same 360x360 dpi (dots per inch) printing resolution as a 24-pin dot matrix printer. By the way, GDOS is part of the ST operating system. It's an extra part of the operating system designed for graphics output on screen and on printers, and is supplied separately on disk. You can get a full, ready-to-install copy of GDOS along with HyperPaint 2 by ordering STF 54 from back issues on page 85.

Transferring graphics

GRAPHICS I'm having problems transferring data from Timeworks into 1st Word Plus using the Snapshot Desk

You need to give the data a label to instruct the program to restore the data ready to be used again. In the example below the same data is read three times.

```
FOR g=1 TO 3
PRINT "Reading ":"g
FOR f=1 TO 6
READ a
PRINT a
NEXT f
RESTORE label
NEXT g
PRINT "Program end"
label:
DATA 1,2,3,4,5,6
```

The label can consist of numbers, letters, the underline character or full stops and, unlike normal variable names, it can begin with a number. The label must occupy a line by itself and end with a colon (:). Using this method of restoring data also means that you can place

all of your data at the end of your code out of the way, and call it when required.

Random numbers

I would like to produce random numbers in a maths program I am trying to write for my small son. Could you tell me how I can generate these numbers, because I'm new to programming in GFA Basic. Charles Lang, Kirkcaldy, Scotland

There are a group of commands you need to consider, RND, RANDOM(x), RAND(X) and RANDOMIZE x.

RND produces a random number between 0 and 1 including 0 but excluding 1, in other words a decimal number less than 1.

RANDOM(x) produces a random integer (whole number) including 0 but excluding x, so if x=10 the numbers generated are between 0 and 9.

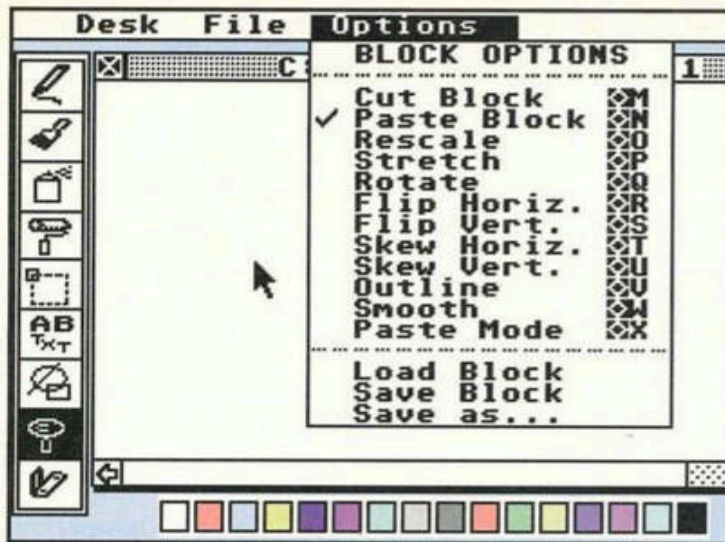

RAND(x) produces a 16-bit number (a number up to 65535, &Hffff hex) using the same parameters as the RANDOM command.

RANDOMIZE x initialises the random number generator (RNG) with the value x. If you generate the same value for x many times then the same numbers start to appear. The best way to use this is to just use the command RANDOMIZE or RANDOMIZE 0. This initialises the RNG with a random number.

To use RND, RANDOM or RAND use the form Y=RAND, Y=RANDOM(x) and Y=RAND(x).

E-mail

You can e-mail your GFA queries direct to Mac Marsden at mac@mentor.demon.co.uk.

It's fab, it's wild and it's groovy. Er, no it isn't, it's just HyperPaint 2 in zoom mode. In case you're wondering, HyperPaint is that grrreat graphics program from ST FORMAT 54's Cover Disk.

Accessory supplied with 1st Word Plus. I have created an A4 sized drawing in Timeworks that I need to take a snapshot of and import into First Word Plus. The problem is that I can't get a snapshot of the complete image, and printing in Timeworks is much too slow. Can you think of a solution?
Gordon Bannatyne, Glasgow

A First, it seems rather odd that you are using a DTP program to create graphics – wouldn't it be easier to use an art package to create your drawings? This leads directly to the solution to your problem, if you have ST FORMAT Cover Disk 54 then you already have an excellent graphics program called HyperPaint 2.

You can use HyperPaint 2 to create images larger than the screen in GEM Image format (IMG), save them to disk and then load them into 1st Word Plus for printing as part of your document. HyperPaint 2 works in low, medium and high resolution, so you can use this method whatever system you have. If you haven't got HyperPaint 2 then turn to page 85 to order a back

issue for the bargain price of £4. Or three copies and a free binder for £10.

You can send your ST Answers questions directly to Clive by e-mailing him at: cparker@futurenet.co.uk or clive@netmag.cityscape.co.uk

ASSEMBLY POINTERS

Tony Wagstaff breaks from composing his overture for the millennium and generates some code instead.

Extended command

How do I read and send command lines that are longer than 125 characters, such as those sent by the Teradesk replacement Desktop?

J Asperry, Ipswich

The command line itself only has room for 125 characters, so to enable longer commands to be sent Atari have dreamt up the Atari Extended Argument Specification, or ARGV. This works by sending the command via the environment string, which has no length limitation. Using ARGV, only the first 125 characters are delivered via the command line.

You can see this with Teradesk by dragging a large number of files, for example, over your program's Desktop icon. The command line, situated 128 bytes above the basepage, will contain a leading length byte of 127, and then the curtailed command line. To get the full command line, your program needs to first check that this leading length byte is equal to 127.

```
move.l 4(sp),a3 get the address of the basepage, do this
before you alter sp
move.b 128(a3),d3
cmp.b #127,d3
beq use ARGV
```

If not then you have a normal command line. If it is, then the environment, whose address can be found at the basepage + 44, needs to be searched for ARGV=. The null terminated string found after the first null byte following ARGV=, will contain your program's full path and filename. Following this comes the extended command line. Unlike the usual command line, this does not have a leading length byte, but will consist of one or more null terminated strings. You need to search for two consecutive nulls to find the end of it.

```
use ARGV
lea 44(a3),a4
move.l (a4),a4
```

```
1$ ber test_forARGV
beq .foundARGV

2$ move.b (a4)+,d3
bne 2$
bra 1$

.foundARGV
3$ move.b (a4)+,d3 ignore anything after ARGV=
bne 3$
```

*a4 now points to the full program path and name

```
4$ move.b (a4)+,d3
bne 4$
```

*a4 now points to the extended command line

```
5$ move.b (a4)+,d3
bne 5$
move.b (a4)+,d3
bne 5$ keep going until we hit a double null
```

a4 has now walked the extended command line. The routine to seek out the ARGV environment is as follows

```
test_forARGV
lea argv,a5
move.w #4,d3
1$ cmp.b (a4)+,(a5)+
dbne d3,1$
rts
```

```
data
argv dc.b 'ARGV='
```

You should now be able to see how to send an extended command line. Simply place as much as practical in the actual command, place 127 into the leading length byte, and then set up the ARGV environment string. If you want to add this to the current environment, you will need to copy that to a new location and then add ARGV. Finally call Pexec or shel_write as normal. Note that under MultiTOS, shel_write will automatically use the ARGV environment string.

Warm soft boot

How do I perform a warm re-boot?
Colin Hull, Middlesex

There are various ways of doing this using software. One is to use the _sysbase variable at \$4FA2. This contains the address of the start of TOS, which contains various information in its initial memory space, such as the TOS version installed. At the eighth byte after the beginning of TOS resides the address of the reset code. Jumping to this address will cause a warm reset.

```
move.l $4f2.w,a0
move.l 8(a0),a0
jmp (a0)
```

This code needs to be executed in supervisor mode, using the Super() or Supexec() calls.

Direct Blit

Can I make use of the blitter chip without using Line-A calls?

E Sudbury, Harpenden

Yes, either through the VDI or by writing directly to the hardware. The former, which utilises the vro_cpyfrm call, was explained in issue 52, (turn to page 85 for details of obtaining back issues). Using the hardware directly is rather more complicated, an example was given in issue 53. The VDI method is preferable to the latter because, apart from being simpler, you can damage your Atari by using the hardware directly if you are not absolutely sure of what you are doing.

E-mail
You can e-mail your assembly language problems directly to Tony Wagstaff at twagstaff@cix.compulink.co.uk.

DESKTOPPER

Since the DeskTopper arrived Nick's been quietly measuring it up for his own ST. From under his desk he brings you the guide to setting it up.

my ST would be wonderful for each other. And indeed they are, because now I've tidied up all those messy, annoying leads that have been winding me up for months, while giving my ST the face-lift that it really deserves.

Unfortunately, I was discovered performing my cosmetics under the desk by Trent, who decided that it would be a good idea if I shared my experiences with the rest of you. So here's the

Now I love my ST so much that when I saw that the DeskTopper (reviewed in issue 64) had arrived in the office I decided that it and

It's a straightforward job fitting the DeskTopper and FreeKeys, but the manual lacks photos, so we've put together this step-by-step guide. Follow it and you'll soon have a yet more impressive machine on your desk.

FITTING THE DESKTOPPER AND FREEKEYS

1

Take the base of the DeskTopper, and fit the clip nuts as shown above. There are six to be fitted, four at the back, and two at the side. Once you've finished doing this you need to screw in the distance pieces to the bottom of the DeskTopper following the instructions shown in Diagram A on the opposite page.

2

Having completely disconnected your ST from its various leads, turn it on its back and remove the screws circled in the photo. Holding both halves, turn your ST the right way up before gently removing its cover by moving it slightly to the right to free it from the internal disk drive.

3

Having carefully discarded the ST's top, which you won't need again, remove your ST's keyboard after first disconnecting it from the ST's motherboard by pulling out the cable from its socket as shown. Now you're ready to connect the FreeKeys extension, before completing the DeskTopper installation.

7

Place the top of FreeKeys over the ST's keyboard before holding it securely and turning it over. Screw the two parts together using the remaining four screws and FreeKeys is now ready to use with your ST, using the curly lead supplied with it.

8

Next, you need to screw the switch panel to the DeskTopper's base as shown. The switch panel here only contains the round cable connector for linking FreeKeys to your ST, but the remaining holes can be used to install the various Power Up options supplied.

9

You now need to attach the top of the DeskTopper to its base. Once done, line up the six holes (four at the back, two at the side), which enable you to securely fix the two pieces together using the remaining six screws and your flat-bladed screwdriver.

Round cable connector

ultimate guide to installing the DeskTopper and FreeKeys add-ons to your ST. And if you're still worried by the notion of removing your ST's innards, fret no longer, because Systems Solutions offer a fitting service - call them on 01753 832212.

Diag C: Connecting the keyboard socket to the ST motherboard (see step 10).

**Power Up**

Your setup can be made even more versatile using Power Up, which enables you to add a reset switch to the front of the DeskTopper as well as move the power switch there, and save you scrabbling around the back of your machine. Because its installation depends on your ST or Falcon's individual configurations, we've decided not to cover it in this feature. You'll find that although it's the most complicated of the three to install, luckily (for you) the manual is much more comprehensive in its coverage of the Power Up installation than it is for either the DeskTopper and FreeKeys, so you should have few problems with it. Some basic electrical knowledge is required, but

you'll be glad to know that soldering is not involved.

Getting started

You're going to need a few basic tools to make fitting the DeskTopper a reality. A pair of pliers is handy when it comes to fitting the clip nuts (see step 1 in the walk-through). Other than this, all you need are a few screwdrivers: one flat blade and two crossheaded, including a very small one such as those used in tightening spectacle frames. Once you have all these, you're all ready to rock and roll, so lock the door and get you, me, your ST, the DeskTopper, FreeKeys and your tools all ready for action. **stf**

What's what?

The basic DeskTopper itself costs £69.95 and consists of the basic box. You can also get FreeKeys for an extra £39.95 (or £99.95 with DeskTopper) if you want to keep your keyboard separate from the main computer. Finally, there's Power Up which, for a trifling £14.95, enables you to move the reset button and power switch to the front of the computer, and to mount hard

drives inside the DeskTopper and power your monitor from the computer, saving you a plug somewhere along the line.

All of these and a host of other extras are available from System Solutions who can be reached on 01753 832212. They also offer a comprehensive fitting service for those of you who are still worried about lifting the lid of your ST.

Diag A: Fitting the distance pieces to the base of the DeskTopper (see step 1).

**4**

Now you can start constructing FreeKeys. First you need to connect the round cable connector to the mounting bracket. This is achieved by placing the cable through the hole on the bracket, as shown above, and placing a screw through each of the two holes. Then tighten them up using two of the nuts.

**5**

Now mount the circuit board by pushing the two screws from underneath the base of FreeKeys, before placing two of the four distance pieces on each of the screws from above. Then mount the circuit board on top of these before screwing the nuts in to secure the board (see Diagram B).

**6**

Connect your ST's keyboard to the circuit board as shown above, then place the keyboard gently on top of the base of FreeKeys. Make sure that you place the back of the keyboard on the raised shelf, under which the circuit board is fixed, in order for Freekeys to fit securely together.

**10**

Before putting the DeskTopper on top of the computer you need to reconnect the round cable connector (see step 4) to the ST's motherboard as shown above. See Diagram C for the correct connecting point on the ST's motherboard socket.

**11**

You can now carefully place the complete DeskTopper on top of the base of your ST. Make sure the four legs line up correctly - you should notice that there are two convenient holes towards the back of your ST for the rear legs of the DeskTopper to fit into.

**12**

If you have a second disk drive, you can slot it into the front of the DeskTopper, trailing the two wires out of the back to connect them to the plug socket and ST's second disk interface. Note how you can now access the ports on the side and back of your machine.

Penetrating

Simon Forrester takes you on another scary ride through the complex and terrifying world of PASCAL. This month we start looking at how to approach writing a database.

Last month you learnt everything you need to know to get simple programs up and running. Simple programs. That's all going to change. This month, you're going to start work on your database.

There are two ways you can write a database. You can either write yourself a crabby little address book, or you can write yourself a full, flexible, malleable database system for powerfully

manipulating complex, precise data. And as 38,000 people prepare to write a crabby little address book, one man turns around and shouts: "No - I want to write myself a full, flexible, malleable

database system for powerfully manipulating complex, precise data." That one person is me, I'm afraid. You're going to write something a little more, well, ambitious.

A complex database isn't really as scary as it sounds - all it means is that you're going to enable the user to define the type of data to be stored, the way it's presented, and exactly what's done with it. Everything is flexible, enabling

the user to create a database on anything from tropical fish to Norwegian leather exports. It works quite simply - your data is structured as a series of records, each of which is a separate file card.

You're going to enable the user to define the type of data stored, the way it's presented, and what's done with it

HUR TIS (or how to write a database, step by step)

The big scary program you're writing has to follow a basic pattern if it's to work. The technical side to all of this is something we'll be dealing with next month, but this month you're going to concentrate on understanding of exactly what you're doing. In nice easy steps, as follows:

1. Accepting data entry

The first thing you want to do when the user asks to enter another record is find out exactly how many records you're holding at the minute, and whether you've got room for one more. Let's assume, for now, that you're working with 50 records. In reality you could store several hundred more, but there's no point in working to silly scales like that just to understand the principle.

So, you need to keep a variable stating how many records you've already stored. Let's call this variable 'tr', standing for 'total records'. All you have to do is make sure this variable isn't equal to 50, and you can go ahead and add another record.

2. Entering the data

Next, the user has to be able to enter their data. What you'll have to do is display the title of each field, and ask for an input corresponding to that field. For instance, if your database is going to be an address book, you'll need to prompt for name, address (about 3 lines), post-code and telephone number. Next to each field should be something like a ':', after which the user types the information. The entire process should look something like this, with the computer's text in bold and the user's typing in normal font (to make things easier for you):

```

Name           :ST FORMAT
Address        :30 Monmouth Street
                 :Bath
                 :Avon
Post code      :BA1 2BW
Phone number   :01225 442244
  
```

3. Getting input

You're doing well so far - you've prompted the user for their entries, so now you need to store what they've entered. You can use the 'readln' command, taking their input as text. All you have to do is store what they've entered. This is where your problems really start.

4. Easy access

One of the great features about disk drives is that data isn't stored analogically - you can effectively skip back and forth from one piece of information to the next easily, whereas

```

File Block Find Mark Options
Line: 1 Filename: DIRTEST.PAS
PROGRAM dir_test ;
TYPE
  fn_range = 1..14 ;
  fname = PACKED ARRAY [ fn_range ] OF char ;
  frec = PACKED RECORD
    reserved : PACKED ARRAY [ 2..19 ] OF byte ;
    resid2 : byte ;
    attrib : byte ;
    time_stamp : integer ;
    date_stamp : integer ;
    size : long_Integer ;
    name : fname ;
  END ;
  path_name = PACKED ARRAY [ 1..80 ] OF char ;
VAR
  r : frec ;
  i : fn_range ;
  path_string : STRING ;
  path : path_name ;
  
```

■ This is a program from the Pascal library. It might look complex but it's actually made up of the sort of simple elements that we're teaching you in these tutorials. By now, you should be able to look at a program like this and have an idea of how it's constructed, and why. If not, you didn't read last month's tutorial, did you?

Every record has fields - they're the individual chunks of data to be stored. The fields of an address book would be name, address, phone number, post code - things like that. Though you can have as many records as you like, with any fields you choose, the names and types of the fields are universal. So you couldn't have one record with a totally different set of fields to the rest. This is handy, because it makes the package easier to use. And once you've defined the fields you want to store the data in, the

program turns into your record database, film collection, address book or whatever.

The file you're saving out will have to contain the header information - for example, the header information for the address field would be 'Address'. It also contains the actual information in each field - for example, the number and street name. For now you're going to create a RAM database, which means that your program loads its information into RAM for the user to play with, rather than keeping it

PASCAL

on disk. This is mainly because RAM manipulation systems are a lot easier than random access disk filing systems. We may be cowards, but it's for a reason.

What to do?

Your program has to consist of the following main sections:

- Define the field information. Your program is going to have to give the user a chance to define exactly what type of database they'd like to create.
- Data entry. You also need a system for feeding the package the data that it's to store.
- Retrieval. Of course, you'll need

to look at the data that you've stored. Retrieval can be anything from just flicking through individual records to searching, printing and cross-referencing.

- Filing. You'll need to load and save the data.

You're going to do this in logical order, so you'll start by writing a simple parser system from which the user can select any one of these options. The parser is the important bit – it enables the user to tell the software exactly what to do and how to do it. You can find parsers in text adventure games (the bit that you type your instructions into), MS-DOS (same again),

platform games (the bit that reads which way you move the joystick) and your Desktop (the whole Desktop system).

Your parser is going to be the central structure to the program, but we're not going to worry about it at great length now. All you really need for the time being is a working model, which will send the user to one of the three program sections listed above (don't worry about filing for the time being).

The parser

Dramatic drum hit please. And your big, scary, dramatic parser looks like the listing below. Type it in, compile it, remember to save the listing and see what it does. But don't get too excited. If all goes well, it should enable you type something in before it stops dead. If all goes badly, er, start again. This is because none of the commands to run from the parser have been added. The commands, when you've added them, will be the parts that do the storing, printing, and recalling of information.

```
program database (input, output);
```

```
var comm: string[10];
var i: integer;
```

File Block Find Mark Options

```
Line: 1 Filename: HAIRY1.PAS
program database (input, output);

var comm: string[10];
var i: integer;

procedure add_rec;
begin
end;

begin
  readln(comm);
  i:= pos('add',comm);
  if (i=1)
  then add_rec;
end
```

■ Programs are always easier to follow if you indent your loops, and sub-routines. It doesn't help the programs compile, but it makes them easier to read.

```
procedure add_rec;
begin
end;
```

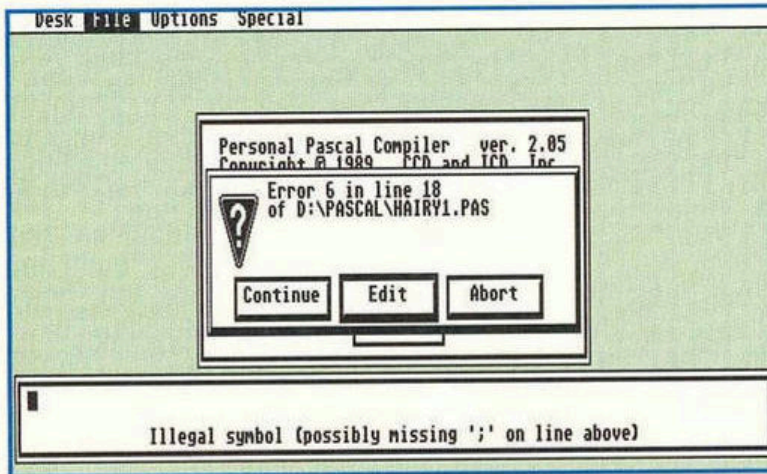

```
begin
  readln(comm);
  i:= pos('add',comm);
  if (i=1)
  then add_rec;
end.
```

Remember, all this part of the program does is enable the user type something in and then act on it by calling the correct routine. How does it work? Well:

```
program database (input, output);
```

Once again, this line simply tells PASCAL that this program is an input and output program, and reminds you that it's a database, in case you'd forgotten.

```
var comm: string[10];
var i: integer;
```

■ Compiling a program always makes for a tense moment. Don't be alarmed when you get errors, just work on everything you're told: the error is on line 18, and involves missing punctuation on the line above. Easy peasy.

users of old tape machines (the 8-bits) are limited to the next piece of information (we call it sequential access), and are unable to go back to an earlier section unless they get the user to rewind the tape. Apart from the increase in speed, this is the main advantage of using a disk drive – could you imagine how a hard drive would work if it was on tape?

This is also helpful for you, because it means you don't have to store your file in memory. It'll slow the program down a little, but the decrease in speed is compensated for by the fact that you can have a database file of any size, as long as you've got the disk space to store it.

5. The difficult bit

Well, it's not really all that difficult to be honest. All you really have to do is open the database file and tack the new entry on to the end.

So far, you know exactly how many records are stored there already, and you know exactly how long each of those records is. You know this because instead of storing them economically, you're going to use a slightly different system (don't worry, it won't be all that bad).

When you set up the string variables at the beginning of the program, you define how long each string is. If each of your field entries can be a maximum of 30 characters and you have 6 fields, you know that the total length of that record will be 6*30 (180). If you're adding the 14th record, you need to pass the 13th to get to the correct position. So the sum is 13*180, coming to 2,340, the amount of characters you have to pass.

So, when you've travelled past 2,340 characters, you add the new ones to the file, increase *tf* by one to signify that you've added

another file, and close it again. Of course, each field doesn't have to be 30 characters long. You might only have a 15-character phone number entry, or a 10-character post-code entry, but as long as you define this from the start and bear the changes in mind with all your calculations, you'll be just fine. These field sizes are common to every single record, though – if you had an indeterminate field length for anything, you'd never know how far to travel into the file to get past it.

6. Cheer

You can sit back, now. You understand the theory behind adding a record to your file. Next month, you'll be concentrating on the full listing that will enable you to do just that, although if you're really brave you might like to try knocking something up for yourself in the meantime. Tatty bye.

Here, you're setting up your variables, namely comm (intended to hold the user's command) and i (used later).

```
procedure add_rec;
begin
end;
```

Don't worry about this routine yet - it's simply the part into which you patch your data entry routine.

```
begin
```

This marks the beginning of your main program routine, in this case the parser. It's the central point of the whole program, unimportant though it is.

```
readln(comm);
```

This uses the readln command to take the user's input, and place it in the comm string.

```
i:= pos('add',comm);
```

Ooh - looks complicated. What you're actually doing is using a routine from the PASCAL library called 'pos'. This routine effectively compares strings, placing the

result in the i variable (at the start of the line). If the two are identical, i contains a 1; if they're different it comes up with a 0.

What you're really doing here is comparing the user's input with the string 'add'. So if the user types add a 1 will be returned.

```
if (i=1)
```

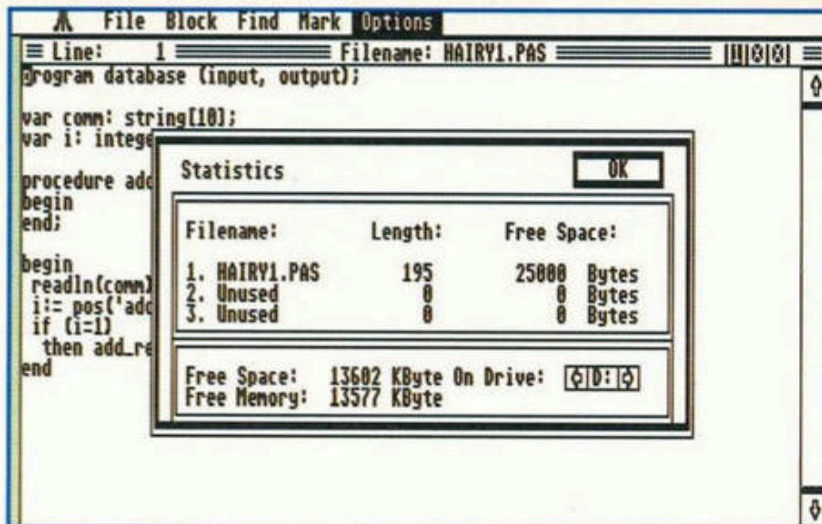

This line takes action on the result. So if it's a 1, it executes the following statement.

```
then add_rec;
```

This is still part of the 'if' command, really. It's the second half, telling the program what to do if the expression in brackets (i=1) is true. In this case, if i=1 you'll execute the procedure add_rec. All you're really doing, right from the i:=pos line, is jumping to add_rec if the user types add. Follow the process through (with your finger, or something) and you should see what I mean.

```
end.
```

It's the end of the program for now. But only till next month...

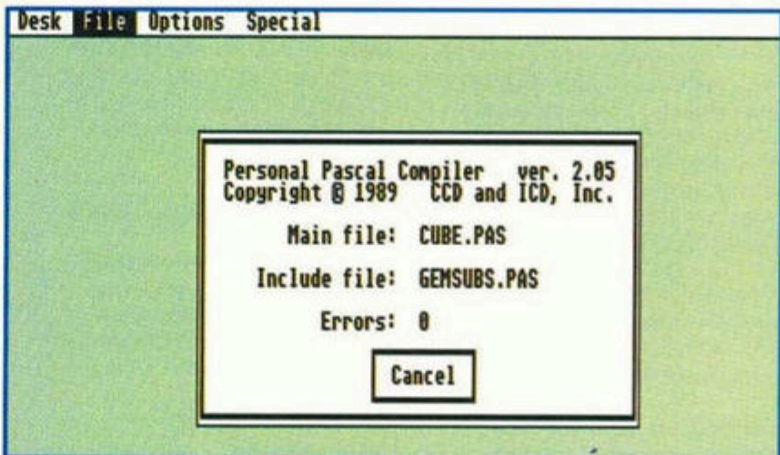

As you can see, there's always plenty of free space in memory for your programs to run in. This one took 195 bytes, out of a possible 25,000 bytes that Personal Pascal makes available on any ST. You can fill the other 24,800 bytes yourself.

Storing information

The next part of the program that you have to consider is how it's going to store all the information that your user is about to enter. For this, you'll need to read the big boxout called 'Hur tis', which takes you through what you need to do

to accept and store information. We'll be dealing with the program in full next month, including a listing on the Cover Disk. If you didn't read the tutorial last month, and you're intrigued to try out this PASCAL business, you need a back issue. Turn to page 85. Okay? *stf*

Now that's what you should be aiming for when you compile your program - absolutely no errors. If you get errors, check your listing for missing punctuation, things like ; and . They're most likely to be causing the problems.

Many a new PASCAL learner comes to me about pictures like this, wondering what it means. Don't worry, it's friendly. Minus control codes, this is in fact the Personal Pascal library. Pity it looks like a load of random tosh really, isn't it?

COLOUR KITS for MONO PRINTERS

Ever wished you'd bought a colour printer instead of a mono one? Wouldn't it be nice to print out pictures in colour? Now you can with Atari FlexiKolor Kit. Each Atari FlexiKolor kit comes complete with everything you need to print in colour, including superb software. The colour kit is simple to use, the ribbons fit exactly the same way as your black ribbons so it will not affect your guarantee. Also on all models listed below paper

alignment is automatic, you do not have to manually align. PRINTS AS GOOD AS COLOUR PRINTER. If your printer is not listed below please phone. Atari FlexiKolor kits for Star LC10, LC20, all Star 24 Pin, Panasonic 1080/81/1123/1124, Epson FX80, LQ100, LQ400, LQ800 etc. Citizen 120D+, NEC P6, P6+, Seikosha 1900+. Please note colour kits come complete with coloured ribbons and software. COMPLETE KIT £39.95

FLEXIDUMP PLUS 3

THE COLOUR SOFTWARE FOR YOUR COLOUR PRINTER

**NO MORE BANDING!
NO MORE WHITE LINES!**

Yes it's true the new Plus 3 will remove banding and white lines from dot matrix & bubblejet printers. Now you can have deskjet quality on dot matrix and bubblejet printers.

- ★ Balance control for picture enhancement
- ★ Select area to be printed
- ★ Select size to be printed
- ★ Page control
- ★ Colour sieve
- ★ Ink correction
- ★ Automatic poster mode for larger than A4
- ★ Gamma correction (fully adjustable and saveable)
- ★ Spooler for colour letterheads etc
- ★ Imports a large range of file types including (IMG) larger than screen size, tiny, Spectrum 512, IFF, Degas, Neo, IFF (Amiga), HAM (Amiga) yes you can even print Amiga pics.
- ★ Colour separation (Print colour on your Bubblejet/Deskjet)
- ★ Ideal for T-shirt printing
- ★ Now with anti aliasing, to get rid of those jagged edges
- ★ Large range of dithering (dot pattern) modes
- ★ Run in any resolution, view, manipulate and print in any other resolution
- ★ Colour catalogue function will print a miniature of each picture configurable between 1 to 8 across
- ★ Will drive 9 or 24 pin Star, Citizen Swift, Panasonic, NEC, Epson, Canon, HP Deskjet 500C, 550C, Laserjet etc

GFA

In the second part of our easy-to-use *GFA Basic* tutorial Simon Forrester starts writing the menu structure for a simple but useful disk utility.

Explained

Last month we introduced you to *GFA* gently, teaching you simple commands, variables and loops, to provide a basis on which to build the rest of the tutorial. If you missed it you'd better order a copy of issue 65, unless you're already fairly confident with *GFA Basic*, because this month we're starting something a little more daunting to keep you people really scared... Er, challenged.

This month, we're going to crack into the first part of a menu-based disk utility, which will be presented to the user as a number of functions to be selected from a series of menus using the mouse

pointer. Disk utilities are truly wonderful things: you can format, copy, and verify disks a lot faster than using GEM; you can copy files in batches (without swapping the disk for every file); and they generally make complicated disk operations a whole lot simpler.

What you're about to do will draw a lot on what you learnt last month - using variables, loops, and simple program structures. You're also going to display things

on screen, which we covered with the PRINT command. This month, you're going to see what you've already learnt in action.

Now the difficult bit about tutorials like this is that we have to write all the programs, which you then type into your ST in a somewhat mindless fashion. To help your learning process, try to work out exactly what each line does and why, before you read the

explanation that comes below it. After all, you'll never learn anything if you just sit and read.

The best way to start thinking about this program is from the point of view of user.

The first thing they're going to touch when this program loads is the mouse. The mouse is a simple little device that enables you to move the pointer around on screen, clicking on things to activate them instead of typing commands (you double-click on a file, instead of typing its name into MSDOS).

Our utility is going to be mouse driven as far as possible - the user will use the pointer to select items from the menu, and

the program will act on that selection. So before you start anything, you need to look a lot harder at...

Mice

You're going to write a simple program that moves a mouse pointer on screen, displaying its co-ordinate location when the left mouse button is clicked. If the right button is clicked, the program stops.

This program uses the commands that you learnt last month, and also introduces a few new MOUSE commands:

SHOWM

This command makes the mouse pointer visible on screen, moving in time with the mouse in a normal, ST kind of way. Had this command not have been issued, the mouse would still move but the user wouldn't see the pointer.

MOUSE mx, my, mk

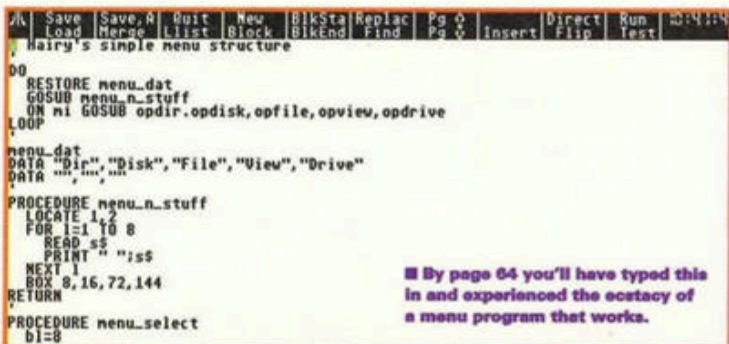

This command returns the state of the mouse in the three variables you specify. We're going to use mx, my, and mk for clarity. The mx and my variables contain the x and

"This month we're starting something more daunting to keep you people really scared... Er, challenged"

THAT PROGRAM IN FULL

Here it is, the final menu structure program. Type it in, and marvel at the fact that there's nothing past the menu (that's next month):

```
' Hairy's simple menu structure
DO
  RESTORE menu_dat
  GOSUB menu_n_stuff
  ON mi GOSUB opdir,opdisk,opfile,opview,opdrive
LOOP
menu_dat:
DATA "Dir","Disk","File","View","Drive"
DATA "", "", ""
PROCEDURE menu_n_stuff
  LOCATE 1,2
  FOR l=1 TO 8
  READ s$
  PRINT " ";s$
  NEXT l
  BOX 8,16,72,144
  GOSUB menu_select
RETURN
PROCEDURE menu_select
  bl=8
  br=72
  bt=16
  bb=144
  mk=0
  DO UNTIL mx=>bl AND mx<=br AND my=>bt AND my<=bb AND mk=1
  MOUSE mx,my,mk
  LOOP
  mi=mx-bt
  mi=INT((my-bt)/16)+1
RETURN
```

y co-ordinates of the pointer, and mk contains the key state. If the left button is pressed, mk=mk+1. If the right button is pressed, mk=mk+2. If both are pressed then mk is 3 (mk=mk+1+2).

HIDEM

Working in relation to the SHOWM command, this command hides the mouse again.

An example program for you to try is as follows:

```
SHOWM
DO
mk=0
WHILE mk=0
MOUSE mx,my,mk
WEND
PRINT mx,my
IF mk=2
HIDEM
END
ENDIF
LOOP
```

■ Cast aside your inbuilt disk operating system in favour of a hand-written system that looks a little like this.

Try typing in and running this program and take a look at the results on screen. But don't bother saving the program. This is really just for you to practice.

But what use is a program that prints the position of the mouse on screen? Well, you'll make use of this knowledge in writing your mouse-driven utility, and you also need to make sure you understand programs at this level of complexity.

To GEM or to menu?

The next task you need to address is what kind of menu structure your utility will be based on, and what screen the user will be presented with on opening the program.

There are several ways in which you can approach this problem. You could use a totally GEM-

OPTIONS

The story so far... Bobby Bubble is truly an adventurer. Not did he only escape from the secret dungeons of Captain Katpolise, he also stole the secret treasure map from the Captain and is now heading towards the Simalta archipelagos.

The map leads to a strange and uninhabited island with a great coral reef called Sharks' Nest surrounding it. Bobby puts on his diving gear and heads into the warm but deadly water. What he doesn't know is that Captain Katpolise is watching him from his stealth submarine 137. Will Bobby find the treasure or end up as a shark snack. You decide!

The AQUATIC ADVENTURE table consists of a number of different ramps and passages.

* On the left side is the DEEP ramp. It leads to a spring at the left bottom of the table. When visiting that ramp you make Bobby ascend deeper down into the coral reef. The DEEP ramp gives 50 800 bonus points and visiting it more often gives you the chance to activate the KICKBACK, gain 2 million, be rewarded with a SAFE BALL or even an EXTRA BALL!

based system. This would involve programming in GFA but using the GEM routines that are already sitting around in memory, giving you the familiar GEM type of screen. But this teaches you little or nothing about BASIC, merely dealing with GEMDOS. An alternative option is to get your screen looking a little like the one above.

This is a little different to the standard GEM interface you're used to seeing on the ST. But then, programming is all about originality, and trying to create a more user-friendly interface is definitely A Good Thing. A learning experience. And another advantage is that the menu can be permanently

■ The handy thing about programs like the ones we're writing is that it could actually go a little way to replacing the Desktop for people without time to mess around.

on screen no matter what you're doing, as opposed to the GEM system where the menu disappears whenever you do anything.

The menu, Sir?

So you'll start off this month writing a menu program, and spend next month adding the individual routines (the chunks of the program that do things like copying and formatting). This month therefore you have to think a bit about how a menu system works.

Drawing and executing a menu may sound like an arduous task, but it's a simple process, really. All you have to do is follow these steps:

- 1 - Draw a box on the screen
- 2 - Fill it with the text for the various menu items
- 3 - Let the user click on the screen

Here's the listing explained in full. You might want to refer to the GFA manual that came with the interpreter - the numbers in brackets after explanations point you to the relevant sections.

' Hairy's simple menu structure

You can add comments to your programs by preceding them with an apostrophe. Or you can use an apostrophe to break up a piece of program to make it visually more understandable.

DO
This is the beginning of your main loop. It will continually access the menu program. (210)

RESTORE menu_dat
The RESTORE command refers to the DATA statements later. Remember this command has placed a pointer at the data straight after menu_dat. (148)

GOSUB menu_n_stuff
This jumps to menu_n_stuff, your menu routine. (215)

ON mi GOSUB
opdir, opdsk, ofile, opview, opdriv
e
This is a complex one. The menu

routine returns the numerical value of the option selected, and you're asking the program to call one of the sub-routines (opdir, etc) on the result. If mi=3, opfile will be executed. You haven't written the routines on the end of this command yet. (199)

LOOP
This command responds with DO, forming a complete loop. (210)

menu_dat:
DATA
"Dir", "Disk", "File", "View", "Driv
e"
DATA "", "", ""

This is the data referred to by the RESTORE command. After the command DATA, you can place lists of information, for the READ command to access later. (148)

PROCEDURE menu_n_stuff
The start of the menu_n_stuff procedure. (215)

LOCATE 1,2
This places the text cursor at the position stated (x,y from the top left corner of the screen). (131)

FOR 1=1 TO 8

You've already experienced the FOR loop, so you know you're setting up a loop to be executed 8 times (for each entry on the menu). (206)

READ s\$
The READ command, corresponding to RESTORE and DATA. As the RESTORE command was issued on the menu_dat data block, this READ command will take the first piece of info from that block ('dir') and place it in s\$. When executed a second time, it'll read 'disk'. (148)

PRINT " ";s\$
Print that information to the screen preceded by a space. (131)

NEXT 1
Completes the FOR loop, printing the next menu item. (206)

BOX 8,16,72,144
For neatness' sake, this draws a box around the menu. (276)

GOSUB menu_select
Then jumps to your real, meaty menu routine. (215)

RETURN
And back to the first section of the program, straight after the

GOSUB that sent you here. (215)

PROCEDURE menu_select
b1=8
br=72
bt=16
bb=144

Those variables are the positions of each edge of the box. (STF65)

mk=0
DO UNTIL mx=>b1 AND mk<=br AND
my=>bt AND my<=bb AND mk=1
MOUSE mx,my,mk
LOOP

You can explain this section as one big chunk. The DO UNTIL command executes the loop command until every condition after the statement is met. The loop consists of one command, MOUSE, to grab the position of the mouse into the variables tested by DO UNTIL. LOOP, as usual, closes the loop. (211)

mi=mx-bt
mi=INT((my-bt)/16)+1

Takes the pixel position from the top of the box and converts it to the number of lines down. (STF65)

RETURN
The end of the procedure. (215)

- 4 - Check that they've clicked inside the box
- 5 - Check whereabouts inside the box they've clicked
- 6 - Convert this location into a line number (for example, they selected line 3 of the box).

You start with a box, which has four sides, and each side has a location on either the x or y axes. So, if you're careful, you can refer to the edges of your box as bl and br (for the sides), and bt and bb (for the top and base).

To check whether the cursor is inside the menu box, you take mx and my (which are the current co-ordinates of the location of the mouse cursor), and run the following tests on them. If any fail, you don't accept the input:

```
1 mx=>bl
2 mx<=br
3 my=>bt
4 my<=bb
```

The symbols '<=' together mean 'smaller than or equal to'. So what you've done is made sure the cursor is inside the boundaries of the menu box when the mouse is clicked. If it isn't then you reject the input and start again.

Menu item number...

Once the cursor is within the boundaries, you need to turn it into the number of the menu option selected. This is easy - the pointer measurement is in pixels, and each of your menu option entries is one character height, or eight pixels, high. To find out how far down the list the cursor is located you need to subtract the current cursor position from the location of the top of the box:

```
mi=mx-bt
```

The variable mi refers to the 'menu item' selected. At the minute, it contains a number that refers to how far down the list the cursor is, as measured in pixels. To turn this value into something a little more manageable, you divide it by 8, which means it's now measured in character height. If it's anything under 8 before it's divided it'll come out as zero, so you need to increase the value by one. To calculate mi, you use the line:

```
mi=INT((mx-bt)/8)+1
```

This means that if the pointer is clicked on the first line of the menu box, the routine returns 1 in mi. If the pointer is clicked on the second line, mi contains 2, and so on.

The following routine is your main menu structure. You send it the menu information, and it returns the number of the item the user has selected:

PROGRAMMING IS THEFT

It might be controversial, but it's true - programming is theft. Because the functions of a language like BASIC are all preset, there's no such thing as an original command in itself. But, just as books are original works built up of unoriginal words, programs are still original works, because the important bit in GFA Basic is the way the commands lock together.

Now reading is an educational process - you tend to pick up new words and word structures in the process. And the same is true of computer programs, but strangely, you don't tend to see people nose deep in the GFA manual. Let's steal a chunk from it anyway:

```
MAT READ c()
MAT PRINT b(),5,1
PRINT STRING$(18,"-")
MAT PRINT c(),5,1
```

Now before you run off screaming, I should warn you now that the MAT commands are to do with matrices, and, as such, are way too mathematically complicated for this time in the evening. One other interesting command is STRINGS. You already know what PRINT does, so let's try that command again:

```
PRINT STRING$(18,"-")
```

This prints a row of dashes, as you'll find out for yourself if you run the command. Let's change the parameters slightly:

```
PRINT STRING$(3,"Wibble")
```

What happens? This appears on your screen:

```
WibbleWibbleWibble
```

Which tells you that the

STRINGS function will print a string a specified number of times. So now let's document this function, where 'count' is the number of times you want to repeat the 'string':

```
PRINT STRING$(count,string)
```

If the function displays text strings (signified by the \$ on the end), you could even use:

```
a$=STRING$(3,"Wibble")
```

This may all seem incredibly complicated, but the point is that you don't have to understand any of this initially. Just have a play around, and experiment with loads of different commands. To get you into the spirit of things, try to work out what this does:

```
PRINT LEN("Arthur")
```

■ Procedures. One of the best things about GFA is the way it shows the nesting of programs as well as the flow.

```
PROCEDURE menu_select
bl=8
br=72
bt=8
bb=72
mk=0
DO UNTIL mx=>bl AND mx<=br
AND my=>bt AND my<=bb AND mk=1
MOUSE mx,my,mk
LOOP
mi=mx-bt
mi=INT((mx-bt)/8)+1
RETURN
```

Now, if you've typed all that in and are now wondering why it doesn't actually work, it's because you need the following program to call the routine. Enter these lines in front of the routine:

```
BOX 8,8,72,72
GOSUB menu_select
END
```

As you can see, the program waits for the user to select something, then prints the number of that selection on screen.

The only way your system will differ from this is that it won't be printing the selection number, it'll be acting on it. For a more accurate description of how this program works,

■ As you move your mouse, the program continues to display co-ordinates. Endlessly.

make your way to the 'That program in full' panel, where it's explained in more detail.

So far, then, you've got a menu system that can be called from anywhere in the program (using the GOSUB command, as seen in the "That program..." panel). This means that you can have a totally free system, with some menu options leading to actual routines, while others lead to yet more menus. All you have to do now is design the structure of the program from the user's point of view, deciding exactly what options go on each menu, and exactly where each menu sits.

The main menu...

The main menu of your program consists of lots of sections:

Dir Getting a disk directory to show on screen. This fits into just about every other category, but it's overused, and therefore deserves a place of its own on the main menu.

Disk Just as the File menu deals with files, the Disk menu deals with copying and formatting disks, as well as verifying and even

defragmenting them.

File This option deals with manipulating files: moving, copying, or deleting them.

View Of course, the user might want to view the contents of a file. Text typing, picture displaying and maybe even sample playing are required, depending on file type.

Drive And the user has to be able to select which drive they're working on.

There are also going to be sub-menus (such as File) and straight routines (like Dir). These intermingle into your menu system - all of which make it truly flexible.

No way

Right. This month we've written the menu system, and next month we're going to write the meat (or, for the vegetarians among you, the lentils) of the utility, which involves lots of routines. But we're not going to finish the whole package. No, there's absolutely no reason why you lot shouldn't write some of the routines and send them in to: I'm getting quite good at this GFA lark, ST FORMAT, 30 Monmouth Street, Bath, Avon, BA1 2BW). The winner will receive not only immense fame and glory on the ST FORMAT Cover Disk, but also something wet... **stf**

ST *First Aid*

Is your ST fraying at the edges? In the first of a two-part series, Simon Forrester takes you through some of the essentials for keeping your machine in the land of the living.

Now if you've spent anything over, say, two months using a computer you'll be well aware of just how easily they can go wrong. It's not that computers are badly designed, it's just that for household items that get knocked, clumped, chipped, scratched, and generally abused by everyone including the cat, they're incredibly

complicated, precisely-engineered pieces of kit. When you consider how careful you are with that expensive stereo, it's amazing that you ever actually take your ST out of its packaging.

All of this isn't intended to make you too scared to use your ST. You just have to appreciate that, particularly when you consider the amount of money you

paid (a fair bit), your ST has to be handled with care. Cared for properly, it could last you a lifetime, but a badly treated ST will just get progressively more glitchy until it dies.

Over the next two months we'll take you through everything you need to know about basic ST care. If you have any other tips concerning maintenance and upkeep that you'd like to share with

the rest of the world, send them to: ST Answers, *ST FORMAT*, 30 Monmouth Street, Bath, Avon, BA1 2BW marked 'Top tip'.

One more thing - 80 per cent of what you read here you may know already. This feature is not to patronise, just to warn and remind. Your ST is a powerful, versatile and valuable piece of kit, and you should take good care of it.

GENERAL TIPS We'll deal with viruses, cleaning and data storage later, but first a few general hints.

Fluids

Some people don't like to get things like drinks anywhere near their computer. The rest of us, who are in fact humans and not aliens, suffer the occasional spillage. There is a way for aliens to drink coffee while typing, though, in the form of a keyboard cover from Kador, which

■ A keyboard cover, in action, live from our London studio. Even as we watch, the user is screaming in agony as scalding coffee pours all over his lap.

enables you to type on a protected keyboard for only £14.95. Because Kador are such wonderful people they've decided to give *ST FORMAT* readers a discount of £3. The kit also comes with a free cleaning kit to get your keyboard sparkly fresh before you safely seal it - contact Kador on ☎ 01443 740281 for more info, right now.

Arizona Computer Club

One of the reasons your ST is so delicate is because everything inside it is so damned small, which means elements can be dangerous things. Before you start worrying about pouring cups of coffee into the keyboard, what about things like moisture in the air? Computers

don't go well with condensation and humid environments. Make sure that your machine is kept in a fairly cool, dry place.

Solids aren't too much fun either. You might like to invest in a set of dust covers to keep those lumps of ethereal crap (*er, dust?* - Jill) out of your keyboard. Dust is dangerous stuff - a major cause of barn fires in fact - and although exploding STs aren't exactly

common (well, not round here anyway), highly-combustive dust and electricity don't go hand in hand.

Phosphor burn

Have you played *Pole Position* in an arcade recently? If you have, you may have been slightly confused by the words 'Game Over' appearing on the screen throughout

■ This may look like a 3D Calc grab, and in fact it is. Y'see, we were going to review it this month and then at the last minute *Zero-5* appeared and... Anyway, it's also a perfect demonstration of phosphor burn, as the ST was turned off at the time.

the game, albeit in faint lettering. This is a failure in the monitor, not the software. If you display something on a screen for long enough it'll be burned on to the phosphor coating on the inside of the glass, leaving a ghost behind for good. This is known as phosphor burn.

What can you do? There are parts of the screen that nearly always display the same thing (the word 'File' on the menu bar, for instance), and after several years of use that menu bar is going to be pretty much burnt on to the screen. What you need is a screen-saver.

Screen-savers are programs that load into RAM on start-up, and

wait, counting how long it's been since you last pressed a key or moved your mouse. If a set time limit is exceeded then the program clears the screen and displays other moving objects, usually on a black background. The menu bar will be removed before it gets a chance to burn itself on.

Since the invention of the utility there have been many advances in the field, resulting in modular screen-savers that do all manner of entertaining things. You can get yourself a copy of *Before Dawn*, an excellent PD screen-saver for both the ST and Falcon, by ordering Cover Disk 55 (page 85).

STORAGE MEDIA

One of the most important things a computer does is store vast amounts of information. In fact, this activity is so important that multi-million-pound industries

selling disks, hard drives, optical disks and CD-ROMs have developed. Your ST is no exception to this rule. Floppies are vital for transferring information from one

machine to the next, and hard drives are essential for any serious ST work. Like any other component in a computer setup, though, disks and hard drives can go wrong with

very little encouragement. There are a few ways you can protect yourself from hard drive crash problems, though.

Troubleshooting – got a problem, mister?

How can I stop hard drive head crashes?

You can never protect yourself totally from head crashes – they can happen to anyone at any time. You can reduce the risk of being hit, though, by remembering a few simple rules about hard drives:

- They should be parked when moved, to stop the head knocking into the cylinders on which the data is stored.
- They should never be turned off when they're reading or writing.
- They should always be kept and run in as dust-free an environment as possible, so that gunk can never touch the head or a cylinder.

Can I protect my data from crashes like these?

The simple answer is no – if your hard drive crashes, it could go crazy. It could crash completely and proceed to destroy everything else on the drive. The only way to ensure that data is safe is by backing it up. Although there's a lot of data on a hard drive, you should always back up the more important bits on to floppies and store them carefully. Any backups you make should be write-protected and stored in a dry place, preferably in a lockable disk box. If the worst comes to the worst, make use of the Cover Disks as blanks, but make backups. Right now.

Disks corrupt when I send them through the post.

There are a number of other things to bear in mind for a totally care-free magnetic media situation:

- Always keep blank disks handy. The chances are that you're going to find yourself in a package wanting to save out an important file, but with absolutely nowhere to

If you're using the British Post Office you won't suffer things like X-rays too often. Overseas post is a different matter entirely – large packages flown anywhere get zapped. If you do have to send something by plane or into a situation in which it'll be X-rayed you might get away with writing "Computer media – don't X-ray" on the envelope. Failing that, if you're sending disks back and forth repetitively then invest in a lead-lined disk box. It'll be too heavy to airmail cheaply, but you'll know your data is completely safe.

My disks have a limited life span, and always corrupt after so long. How can I stop this?

Floppy disks are always problematical, and the problem starts when you buy the disk. When given the choice between dodgy, unbranded, cheap tat and a box of 3M, get the 3M. The difference in quality between one brand of disk and another is staggering. When you've got your disks home, there are a few basic things you should do:

- Store them in a dry place, away from all moisture (not in that mouldy cupboard by the sink).
- Never do silly things like sliding the shutter back yourself.
- Keep them away from anything emitting strong magnetic or electromagnetic fields such as monitors, telephones, electric motors and the Des... (No, sorry, just kidding there.)
- Never store them in environments colder than 10°C or hotter

than 60°C. God did not intend such temperatures for man nor magnetic media.

- Never insert or remove floppy disks from the drive while they're being accessed.
- Never turn your machine off when a disk is being accessed.

My disks get stuck in the drive.

Most drives don't actually eject your disk. Instead they let the spring in the shutter do the hard work of pushing the thing back out into the open. It's a complicated system, but makes for less parts to go wrong internally. If you get a lazy disk – one that doesn't have a mechanism strong enough to push it out – stop using that disk. Take advantage of the fact that it's already in the drive and copy it, but don't try to use it again. It's not worth it.

Sometimes disks just get stuck. Either they shed parts (like the shutter) into your disk drive and get jammed, or your drive eject system fails. In such cases, the last thing you should ever do is start poking around with a screwdriver. Turn the machine off, then roll it on its side, and try again, letting gravity help. If you still don't have any luck, try grabbing the disk with a pair of tweezers and pulling, while holding down the eject button. If at any point the disk jams and doesn't want to come out, don't force it – you could be dragging a twisted shutter straight into your read head, and that hurts. Instead you need start talking nicely with a local electrical goods shop that offers a repair service.

My disks keep falling to bits.

The other thing you tend to forget about floppy disks is that they aren't made of titanium. It's very easy to break the flimsy plastic casing, and even easier to damage the spring-shutter mechanism. Apart from remembering not to frisbee the things around (pleasing though it is, and something we tend to do a lot round here), you should always package disks carefully for postage:

- Wrap them in bubble-wrap (while being careful not to slide into a bubble-popping frenzy).
- Make sure the envelope can't be folded – a piece of corrugated cardboard works wonders.
- Place the disk in the envelope shutter down – the flap end of the envelope gets the most abuse.

My hard drive won't boot.

If you bought your hard drive new, you'll have received a disk with it containing the hard drive boot software that lets the ST know there's something there. Which you undoubtedly filed away carefully. If your drive won't boot then the odds are this is why. Re-install the driver on to your hard drive, and try again. Or you may have dirty connections somewhere along the line, in which case you need next month's section on cleaning your ST.

Always treat reformatting your drive as an absolutely last resort. When you format a drive, you erase its contents totally, so be prepared to start from scratch.

Other tips

There are a number of other things to bear in mind for a totally care-free magnetic media situation:

- Always keep blank disks handy. The chances are that you're going to find yourself in a package wanting to save out an important file, but with absolutely nowhere to

save it to. In these cases it's easier to keep a few formatted, fresh disks standing by rather than write over another important one.

- Always clearly label disks and files. If you're looking for your CV file, which could be called anything from Wibble to Rwgfrtyb on any one of five unlabelled disks, you're

heading for serious blood pressure.

- Always write-protect your disks. Most disks you'll use only need to be read from, so get into the habit of flipping those tabs. It's easier to flip a tab back than to recover the utility you erased to decompact *Starball*. Obviously, you should practise a little discretion here. **stf**

Next month we carry on the tutorial, looking at cleaning your ST, and dealing with viruses. And Nick gets his Marigolds on in a very attractive manner. At least, we thought so. Your machine will love you for it.

BUYING BY MAIL ORDER

 **The number of bargains available through mail order has never been greater - just follow our guide.**

1. Before you send any money, ring the supplier to make sure the item you require is in stock. Ask questions about the company's policy on delivery and returns of faulty equipment. Make sure there are no hidden costs such as postage and packaging. Find out when you can realistically expect to receive your goods.
2. Make sure you read the small print on ads.
3. Beware of companies that don't include their address on their adverts,

- or that don't answer or return your calls.
4. By far the best method of payment is by credit card. If you're ordering goods that come to more than £100 in total value, you are legally entitled to claim compensation from some credit companies if the retailer goes bust. Check your credit card company's policy. You can also try to get extra insurance in advance.
 5. If you're not paying by credit card, pay by cheque. Never send cash. Avoid postal orders.
 6. Always keep a record of your order, and make sure you keep it somewhere safe. If you're buying by credit card keep a note of the time of the order and ask for an order number. When ordering anything over the telephone, double-check the price before you part

- with your money.
7. If you are sending a cheque keep a note of the cheque number, the date and the exact value. Make sure you know the name and some details of the mail order company.
 8. When you receive your goods, check them carefully. If anything is missing or faulty, contact the supplier immediately.
 9. Order from the most recent issue of STF.
 10. If a problem does arise, contact the supplier first. Calmly and politely tell them your problem. Most problems turn out to be minor hitches or misunderstandings that can easily be resolved. If you think you have a genuine grievance, contact your local Trading Standards Officer. The number is in the phone book.

BUYER BEWARE

Inclusion in this list does not mean ST FORMAT endorses or recommends libraries, user groups or companies in any way.
 If you run a PD library, or a user group/club, and you'd like it to be included in the list, please send details (and your latest catalogue if it's a PD library) to: The Directory, ST FORMAT, 30 Monmouth Street, Bath, Avon, BA1 2BW.

S CAN BE YOURS...

THIS MONTH SUBSCRIBERS GOT:

A WONDER DISK CRAMMED WITH 10 SMART PROGRAMS...

NoBI - RACING: a Snake style game for one or two players. Runs on 1MByte STs, TTs and Falcons.

Stoat keepers aren't as common as they used to be, but Family Tree 2 preserves their memory for eternity. (What are you on about? - Trent)

FAMILY TREE 2: keep tabs on your family's dubious past with this useful and easy-to-use genealogy program.
LPRINT: printing will never be the same again with this nifty little utility.
APPLIER: frustrated by your

ST's limited 'Install Application' function? Then you really need this!
TXT-2-PRG: make your text-files readable just by double-clicking on them.
KEY EDIT: alter your keyboard's layout for no other reason than that you can!
GSS CLOCK SET: set your ST's system clock on boot-up with this little gem.
TAPE MAKER: make inlay cards for your band's demos!
DABELFEATURE: redirect your drive's accesses and control GEM windows.
STTOPC: DOS program for PCs to read ST disks.

Lovely colours (on the TT and Falcom). But NoBI - Racing is addictive whatever its plumage.

...AND NEWSLETTER WITH FULL DISK INSTRUCTIONS

To subscribe quickly and easily, call our hotline number 01225 822511 and have your credit card ready.

SHARE AND ENJOY

We all know about piracy and the damaging effect it has on commercial software. But surely shareware at least is safe from the cracking crews? Frank Charlton investigates a disturbing new trend...

Piracy. There, that's it out in the open. While we've spoken about piracy before in *ST FORMAT*, we concentrated on the visible side of the problem - commercial games and serious software. Piracy isn't just confined to the games world, or high-end, high-price delicacies like *Calamus SL* or *Cubase*, though... Shareware isn't a new idea, it's been around for years. The idea is that an author bypasses the commercial software houses, and releases his latest magnum opus via cheap or free distribution channels - PD libraries, BBSs and the

like. Because the author doesn't have to spend time and money packaging and distributing it, the program is usually much cheaper than its commercial counterpart, and often just as good quality - if not better. You buy the program for the cost of a disk, and if you like it you're morally obliged to send the author some money for it. If it's not suitable for you, just wipe the disk - after all, it didn't exactly cost you a fortune to start with, did it? Releasing a fully working copy of a program is a risky endeavour, because it relies on

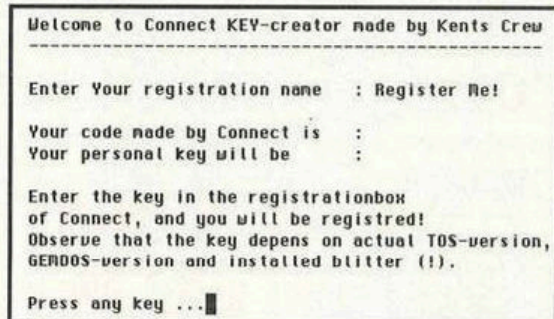

"Releasing a fully working copy of a program is a risky endeavour, because it relies on basic honesty..."

■ *FANS!* is the only program of its type. What a shame it would be if Eric were to be dissuaded from producing future versions by the unscrupulous mob...

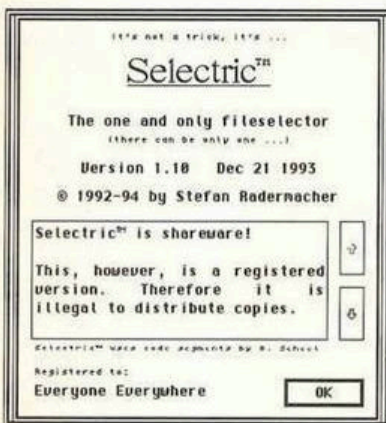

basic honesty. The concept seems to have worked well in some markets, notably on the PC, and especially in America. Unfortunately, if no one bothers registering the software, the author has given up a large chunk of his time with nothing to show in return. One solution is to release the package in a slightly 'crippled' form, with certain

key features either restricted or disabled entirely. It's still usable, but the added incentives of extra features, printed manuals and future support are often enough to bring the registrations in for the full version. Some programmers then send you a complete, personalised copy of the program, while others send you a key file, which unlocks

the version you already have. Sadly, shareware that needs a key to

■ Create an illegal registration key for *CoNnect* in five seconds with this program. How good do you think future support will be?

■ *Selectric* is an excellent file selector, and cheap too. Why rip off a copy, and then complain about the state of the ST nowadays? Hypocrite!

THE YAK CHATS BACK...

We managed to catch the venerable Jeff Minter between bouts of writing for the Jaguar and playing classic Williams arcade games, to ask his views. Jeff has released a few of his ST games as shareware - the frantic *Llamartron* was released as a full version, and the not-quite-so-frantic *Revenge of the Mutant Camels* only comes with the first ten levels 'til you pay up.

Jeff, what made you release ROTMC in a limited form?
 "Registrations of *PC Llamartron* were poor, and we wanted to see if we could get people to register by indirect coercion."

So how good was the level of registration you finally got?
 "On the ST, excellent. On the Amiga, nowhere near as good, and on the PC even worse. I wouldn't mind doing it for the ST market again but I'm not impressed with the response in the Amiga and PC areas."

Maybe we'll see a finished version of Hardcore after all. And Jeff's view of shareware pirates?
 "May the fleas of a thousand camels infest their pubic hair forever, and may they never dream of goats."
Er, quite. Don't say we didn't warn you...

■ Jeff Minter - the uncrowned king of shareware, and probably one of the biggest victims of piracy.

PINBALL WIZARD

Remember *Starball*, the brilliant pinball game we gave you on *STF* Cover Disk 64? We thought it was the business, and better than most of the commercial games we've ever seen. With such an auspicious start under his belt, we tracked down the author, Dave Oldcorn of Volume 11 Software, for his opinions:

Starball isn't limited in any way - it's a full game. Have you ever released shareware with certain features taken out of the unregistered version?

"I did release two versions of my Falcon JPEG viewer, one with and one without SDP; the 030 version is public domain, and the DSP version is for-sale software. It's not exactly shareware, but the concept is probably similar enough."

Why did you feel that you had to do this?

"Otherwise I very much doubt I would have received any registrations at all. With the *Brainstorm* DSP viewer available, and with certain other image viewers

about as much use as archive maintenance tools as a chocolate fire-guard, I still don't think people would really be that inclined to register."

So you didn't think people were honourable enough to register?
"It's not the honour that's the problem, it's people finding time to do it. Take as an example, *Llamatron*. I kept on saying 'I have to register this' every time I played the game, and then would forget about it. The same is true of *Starball* to some extent - £5 is

not exactly a lot to ask." *Many users like the key system, because it means that they can get their registered version quickly, by picking up the key from a BBS or electronic mail network. Unfortunately, it can also mean that the smart cracker can easily gain access to disabled features. Dave, would you use a key system, or just produce an entirely separate version for registered users?*

"I'd give them an entirely new copy, because anyone who knows anything about the Atari, and because of its adult market that's a lot of people, could take out key systems in minutes." *Any last words or thoughts on the Atari shareware market?*
"I've seen people write software to do trivial things that a programmer could knock up in hours, and then ask £20 for registration. Gross profiteering of that

order is disgraceful. I put two and a half years' work into *Starball* and I'm still only asking £5, because that's a reasonable price for shareware if you aren't asking a return. There are very few people who charge fair shareware fees out there. I think if they did, they might get better registrations.

"Having said that, there is also a lot of good shareware that does justify its price, and it deserves support. I just bought myself a PC yesterday, and the person who runs V11's business side is loath to have us finish the other project we have planned for the Atari, because it isn't sound financial sense, and I've seen no evidence that he isn't absolutely right. Therefore you will almost certainly see *Starball* on the PC before our next Atari project, because we need the money, and *Starball* on the Atari isn't doing it. I have to make my living from this, and you would think a three-person company could get what it needs from the Atari, but it can't."

operate properly is open to the abuse from the minority who think it's big and clever to crack a program and distribute it freely. With the decline of certain sectors of the commercial ST market, more

authors are agreeing that shareware is the way ahead for the ST. We're seeing some astounding packages released as shareware with affordable registration. Excellent utilities like the

Edith text editor, *Gem-View*, *Speed of Light* and even full commercial quality art programs like *Munch* are all suffering due to the activities of the unscrupulous few.

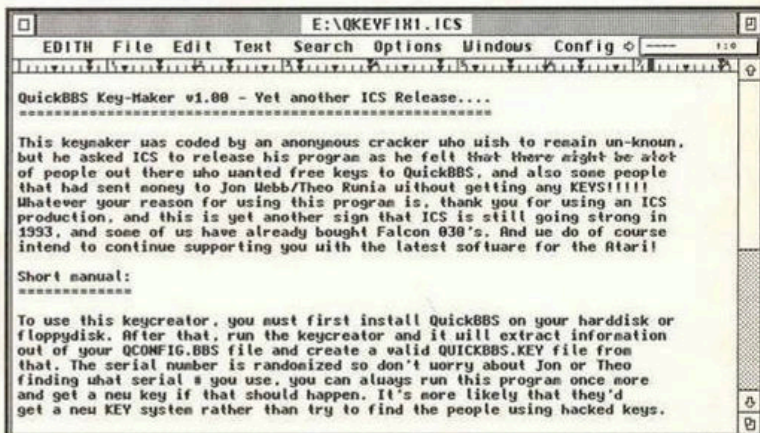

From the horse's mouth

We spoke to a number of shareware programmers about this problem. Some of them had been directly affected by piracy; all had strong views on the subject. Eric

March is the author of *FANS!*, a 16-colour ANSI screen editor for BBS system operators. Eric told us, "I can say for certain that *FANS!* has been pirated - apparently by a group known as Elite. I couldn't

even begin to guess at how they did it. Although I don't claim my protection scheme is the best, it's certainly devious enough to make it hard to crack, coupled with the

"Shareware is the way ahead for the ST. We're seeing some astounding packages released as shareware..."

■ This cracker thinks it's okay to rip off a program because he has some kind of a grudge against the authors. This is incredibly sad. Sorry.

fact that pertinent registration information is encrypted with my own routine. *FANS!* seems to have been pirated quite liberally in Germany - I got an e-mail from someone who admitted to having a pirated copy straight off, but said he was going to register, and just wanted some information about what's going to be added to future versions."

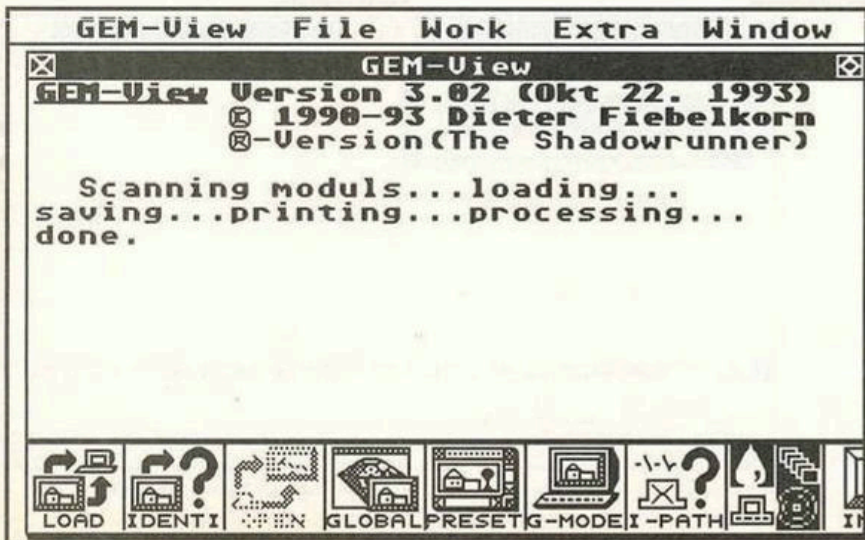

"I released my first version of *FANS!* with the Save option intact in the hope that this show of faith would encourage some users to register, and others to experience a slightly bigger pang

■ "The Shadowrunner"? These guys are too embarrassed to give their own names - they know what they do is wrong.

of guilt. It was, of course, something of a mistake, even though I have had a number of registrations so far. In the five-and-some months that it has been available, thirteen people have registered. By and large, this is not an impressive number. As a result, future demo versions of *FANS!* will experience more crippling."

Speed of Light

We contacted Stuart Denman, author of the *Speed of Light* image viewer, to tell him that we'd seen a text-file telling users how to unlock the extra features in version 2 and above. Understandably, he was peeved... "These *****! This really annoys me. People wonder why the Atari market is diminishing when this kind of thing goes on? How do they expect us to continue

TIPS FOR REGISTERING...

If you're concerned about sending money off to register a program, there are a few simple rules you can follow.

Check the copyright date on the program. Programmers are like the rest of us - they change computers, move house, or give up computing altogether. Some may still want you to pay because you're using the program, while others may tell you they aren't interested. If a program is really old, chances are it isn't supported. Which leads us straight on to...

Write to the programmer. A simple letter can confirm the status of a program, and whether the author is still at that address. If you get no reply after a couple

of letters, then at least you've made the effort to find them.

Check with other users via user groups, bulletin boards and even the letters page of *ST FORMAT*, to see if anyone else has experience of the software you want to register. Others may be able to save you a lot of hassle.

Never - NEVER - send cash through the post. It might be tempting to bung those leftover Deutschmarks from holidays into an envelope, but it's a recipe for disaster. Ask at the Post Office about International Money Orders. It costs more this way, but it's safer. Find out if anyone else is about to register the same program - by combining your orders, you can save money on handling charges.

writing new stuff when they do this?" Since we contacted him, Stuart is intending to change his protection routines in future versions, to defeat the hack. How long until a new text-file is released, though? Thankfully, Stuart hasn't been dissuaded from writing new versions, but it could easily have happened - and could you really blame him for it?

The response was amazing. E-mails were literally flooding in within hours of the message being sent out. We asked everyone to answer a specific set of questions, and add any comments they might have. The general tone of the replies was upbeat, and almost all were concerned with the issues raised. The results of the Internet questionnaire make interesting

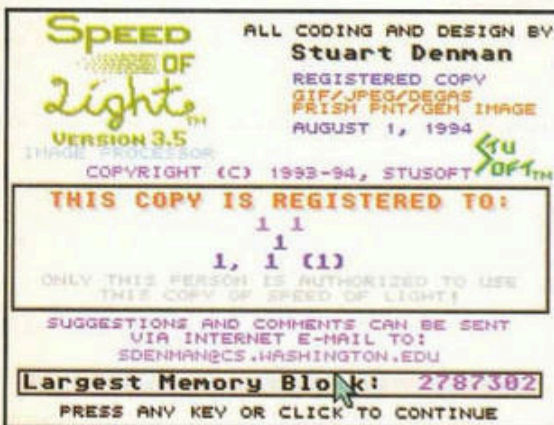

reading. When asked if they had ever registered shareware, 89 per cent said yes. A good start...

Nearly 80 per cent had continued to use shareware without registering - reasons ranged from "I'm skint" to being worried about lack of support and sending money abroad.

37 per cent of people had come across illegal 'cracked' shareware through friends and

contacts - 20 per cent had seen cracking programs that enable you to register a program without paying. Only 26 per cent said they would certainly use it, but a further 37 per cent said they would have a look at it, to help decide whether or not to register the real thing.

We asked whether the future for the ST lay in the commercial or shareware market - half said both

No sooner had *Speed of Light 3.5* been launched than someone distributed instructions on how to get yourself a 'free' registered version. What's the point?

Lies, damned lies, and statistics

You read about the Internet last month - it's a huge, sprawling collection of computer systems connected together, it's unregulated and it's a great way to contact lots of people at once. We posted a questionnaire in the main Atari newsgroup, asking for feedback and opinions on the piracy issue,

Camas, Washington 98607

This excellent BBS off-line mail reader suffered because of shareware piracy too. Beavis and Butthead? Sorry, but this kind of pathetic piracy sucks...

had a part to play, and most others thought shareware was they way forward. A few decided our ST had no future at all, with one saying the ST's future lay "in a landfill"!

Register!

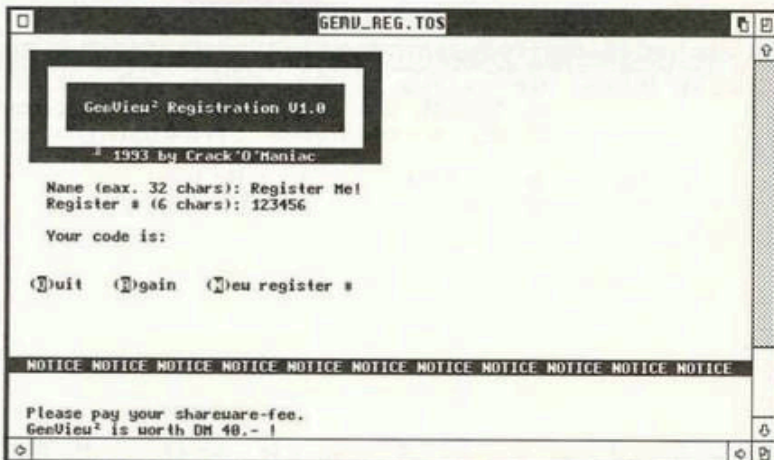

So what is the future for our beloved machine? That's up to all of us to decide. Piracy does have a negative effect, whether it be commercial software or shareware. If you find a shareware gem that proves useful to you, do something about it - pay your registration! If you can't afford what the programmer is asking, write a

letter and offer what you can afford. Many authors will be happy to see any financial reward for their work. By using cracked copies, or not bothering to register, you're running the risk that programmers

"People wonder why the Atari market is diminishing? How do they expect us to continue writing new stuff?"

may decide not to bother any longer, and then we're all stuck. Most shareware is written by people like you and me - I certainly don't know any who drive Porsches - and they need to eat and pay bills like the rest of us. If

you want to be using your ST in the years to come, don't be tempted by that freebie copy from a mate, and stop to think about the guy who created it. *stf*

See the notice at the bottom? This guy cracked it, and yet he still recommends paying your shareware registration dosh. Odd, eh?

GAMEBUSTERS

Four little light things which, when lit in the right combination, do all manner of great things, including restoring lives.

Destroy all the little purple men in your endless quest to repel the slime (or something...) and this woman provides more, via her red lips.

The space time warp, and the button to activate the llama level.

Getting the ball in here is the easy way to kill the purples.

Avoid this one - it'll repair the sideguns completely, and they'll trash the ship.

You'll need to hit these guns six times each to destroy them.

Hit the forcefield to destroy it, then get the ball in here to get the seven bonuses.

Send the ball into this black area and back down the pipe (by hitting it softly) to activate the llama bonus level.

It's only a points bonus - grab it if you want the highest score, but it won't help you see any more of the game.

Hit the head in the chin for a points bonus, and into its mouth for the llama level.

Firing the ball into here sets off loads of groovy happenings - kickbacks being just one of them...

When the gremlin grins with clenched teeth, it'll stop the ball rolling off the table.

You now the routine by now. If you have any handy hints, top tips or even scurrilous scams, send them to: Gamebusters, ST FORMAT, 30 Monmouth St, Bath, Avon, BA1 2BW.

The complete guide to Starball, with a little help from Simon Forrester.

Two months ago, back in issue 64 to be precise, our Nick saw to it that every ST FORMAT reader got themselves a copy of Starball, the FORMAT Gold-winning pinball game. Two months on, the tips, guides and solutions to the game created a pile on our doormat so high that we just had to do something with them. We found a match and decided to cut down on heating bills.

Shortly before this, however, we extracted the best tips (and a few lucky people) from the pile, and built ourselves a Starball players' guide. The tips below are mainly the hard, selfless work of Richard Ollerenshaw from Warwickshire (somebody's got to be) and Ross Burton from Essex (enough said).

On the table

We start with a complete annotated pictorial guide to the Starball table. It looks similar to the review from issue 63, but there's more here. Much more. The table is split into three main sections.

The slime

The top section of the table is the easiest to get around. At the top left is a face, circled by purple figures. If you destroy every figure, the face in the centre of the section becomes covered in more and more slime. Shooting the birds in the top right corner reduces the slime.

- If you cover the head in slime completely (by destroying three sets of purples), you're confronted by two aliens. If you shoot these, an arrow appears above the top-left face. If you enter the head, you're taken to the bonus level.

- The lights, guarded by the birds in the top right corner of the section need to be hit until they all display the same colour, to pick up one of the following bonuses:

- Grey - energises ball
- Blue - increase multi-bonus
- Red - extra ball

The spaceship

The middle section has to be the most involved in the entire game. You tend to spend a lot of playing time here, trying to build the spaceship. The slow

TAKE IT EASY

Some people don't like speed. Some people like to take it slowly. Arsenal, for a start. Michael Walker writes: "When you're trying to do a tricky manoeuvre, hit the <Backslash> key. This increases the amount of frames your ST has to display and slows the whole game down." Cheers, Michael. And it's a good thing Nick, our resident footie nutter, isn't writing this.

BONII

The bonuses in *Starball* are liberal to say the least. The holes that give bonus marks also give multi-bonus marks, which are worth collecting, because they increase the amount your scores are multiplied by.

way to achieve this is to shoot the ships circling the sections you're building, but it's slow, and you're busy people. There are a few things you can do to speed the process up.

- Try to get the ball into the hole on the left, first destroying the force field. This gives you the following bonuses in order (should that be bonii perhaps? Sounds a bit odd):

- Add part to the ship 10,000 bonus points
- No bonus
- Destroy the guns
- Superbumpers
- Complete ship

- Alternatively, you could hit the side-guns roughly six times each to destroy them, which would stop them launching missiles at the rocket you're trying to build.

The fly

The bottom third of the table is the most perilous for the simple reason that if you fall through the traps here you're dead.

- Try to get the ball into the fly's mouth. It will either be spat back out, or you'll be taken back to the top section of the table or to one of the four subgames.
- Fire the ball into the chin of the figure to the right for a Jimmy Hill Chin bonus.
- Use the bumpers. If you hit them enough they

explode which, although it sprays avoidables about, also creates kickbacks. These stop the ball falling down one of the channels on each side of the table.

- If you're trying to get the ball back up the screen to the middle section, you should let the ball run down the left flipper, only firing when the ball reaches the tip of the creature's ear.

■ *Starball* – it's shareware, it's excellently written, nicely weighted, intensely good fun and it's got wonderful graphics. Sonics aren't bad, though.

- If you manage to get the ball up to the middle section but it flies across the screen and comes back down, you'll score a Skill Shot Spanner Bonus.

SICK NOTES

Some of you missed *Starball*, didn't you? Well, turn to back issues on page 85, and order your copy of issue 64 right now. Simple, huh? If any of you didn't buy that issue and you ring us up with either of the following excuses in an attempt to swing a freebie copy, you'll be laughed at by the whole team:

- I accidentally formatted my copy.
 - It didn't work (sorry, but you need to send it to Disk Copy Labs – we don't keep copies).
- If, however, you devise an original, empathetic or funny letter, you'll probably swing yourself a copy. It is PD after all, and we're easily amused.

THOSE SUBGAMES

Invaderball

The point of this subgame is to shoot the invaders with your ball before they reach the bottom of the screen. A few hints that might help you out in achieving this:

- Shoot the nearest rows first. After all, they're posing the most immediate threat.
- Shoot all of the invaders flying in the middle for an extra part to this subgame.
- Try to get your ball bouncing on top of the invaders as a last resort for points.

Eggball

The object of Eggball is to smash each quarter of the egg, releasing the insects inside. This may initially seem difficult, but:

- Keep the ball travelling slowly.

■ Eggball. Er, yes. What exactly were the influences for this one, then? And just who is this bloke?

- Always try to hit the two quarters nearest to you at an angle, so the ball doesn't fly straight back.
- Kill as many insects as you can before breaking the next quarter open.

■ Arkaball, the breakout level. Try to get the ball above the tiles for the easy way out.

Arkaball

The brilliant idea of integrating other game styles with a pinball table works just as well with Arkaball. Just make sure you remember:

- There's plenty of time, so take it easy.
- Try to break out rather than destroy every block. Once you get the ball bouncing around on top of the blocks you're set for life.
- Never hit the ball straight up – always try to hit it at an angle.

■ The barking-mad bonus level, activated via a laborious process. Jeff Minter would be proud.

Llamaball

You can get to this secret, barking-mad bonus level by following a few simple steps:

- At the start of the game, before firing the ball on to the table, try to send it into the black area just before the top of the chute, so that when the ball comes back down the words "Secret B5 sequence enabled" are displayed.
- When you're at the top section of the table, fire the ball into the bonus hole, giving the message "Shoot head for llama."
- Let the ball fall to the bottom section of the table and aim it with the left-hand flipper into the mouth of the head on the right-hand side. A llama should now appear.
- Shoot the llama (it flashes white) several times, to find yourself on the Llamaball bonus screen.
- In classic Minter style, shoot everything.

ASSORTED HINTS

Ishar 2

Richard Ollerenshaw has been a busy man. As well as helping with our Starball solution, he's managed to come up with a few more gaming hints and tips, the first of which is for the Silmarils classic.

There are some opponents that you need hit only once, step back, recharge, then step forward and hit again, repeating the process – the ST is too slow on both attack and defend, which means that you'll never get hit. And don't forget, with every chance you get, administer first aid from everyone to everyone.

Outrun

That Ollerenshaw bloke's excelled again, with a handy tip for the US Gold driving classic, saving you all from humiliation from the pouting blonde in the passenger seat. Type 'STARION' on the title screen, and the following keypresses become active immediately:

- B – Extra time with extended play
- Q – Program information
- S – Skip a level
- T – Extra time

Rainbow Islands

And Richard reliably informs us that holding down the keys Q, W, E, R, T, and Y simultaneously gives you infinite lives. Good.

Another World

Delphine Software's chilling epic has been ripped clean in two by Mike Francis, who's handily supplied the full level codes for the game:

- | | |
|--------|---------|
| 1 EDJI | 7 FADK |
| 2 HICI | 8 KCIJ |
| 3 FLLD | 9 ICAH |
| 4 LIBC | 10 FIEI |
| 5 CCAL | 11 LALD |
| 6 EDIL | 12 LFEK |

Watch out for next month's Gamebusters, in which Mike Francis takes over a whole spread with his complete *Another World* solution. Cheers then, Mike.

Now that's a damned good game. *Another World* not only gives you adventure, action, and a good creepy atmosphere – you get an enormous gun too.

Bath City. We're talking about a team that once fell off the bottom of the coupon. And you get to manage them. And you paid good money for it. There's something seriously wrong with this game, surely?

Premier Manager 2

As M Winter, the author of some excellent Premier Manager 2 tips puts it, here's how to avoid a dose of the Mike Walkers. We're leaving Mike Walker alone for now though, as he did send in the rather excellent Starball cheat. Anyway, Premier Manager 2:

- Choose a good club at the beginning of the game, such as Bath, Halifax or Welling. The home friendlies and foreign matches attract much bigger crowds.
- Buy out every contract player you can. After all, even if they turn out to be rubbish players, they can always be sold off at a profit. Buy three average players instead of one genius – he's bound to get injured or retire. Always have at least two goalies.

- The most important staff are the physiotherapists, the scout, and the youth team manager – get the best you can afford. A good youth team manager provides cheap squad players who can be used or sold.
- There are three real ways to keep your directors happy: build covering for all stands to give extra advertising; sell a steady stream of players supplied by your youth team to get a good run in the cup; publicise every match – a fourth-round tie at home against a premierships opposition still brings in a lot of cash from directors.
- Forget the beautiful game – long balls and 11-man defenses are vital for reaching the league. Only later when you can afford better players should passing be a consideration.
- Once promoted, ditch your old team ASAP – it won't cope. Go to an established club like Colchester. Never sign up for longer than two years.

BLUNDERING ON...

Don't worry, Blunder is dead. But his spirit lives on – Paul Dwerryhouse from Kent needs help with one of the oldest (but one of the best) flighty games, Damocles. So...

Go through the normal procedure at the beginning and fly to 12:14 and get the computer. Go to 15:03 and buy the pressure suit. Move over to Snow Island and go to 03:00 and pick up the cupboard. This is a Nova-trigger in disguise. Fly to Bare Island 06:02 and enter the transporter on the ground floor. Keep going in until you get to Ur City on Gaea at reference 07:01. Pick up the sideboard. It is a Nova-trigger in disguise. Come

back the way you came and fly off to Metis. At 05:06 is a building with a phone and a table. Walk to the table and the wall should open. This is a door in disguise. Go in and there is a washbasin. Take it. This is a Nova-trigger in disguise. Next fly to the Chaldea Metropolis on Gaea and land at 06:06. Nick the gold from the basement and fly to 05:08. Sell the gold and fly to 05:06 and buy the Hi-Fi system. You've guessed it. This is a Nova-trigger etc. Fly to 09:02 on Ur and pick up the Novabomb in the basement. Fly to Damocles, drop the Novabomb on it and get out of its way. Fast. Turn on all the Nova-triggers in disguise and Damocles is destroyed. You now get loads of money to spend as you please.

What a long strange year it's been

1994 was an important year for the ST and Atari: exciting, confusing and even depressing (when the World Cup ended). Trenton Webb tries to make some crazy kind of sense of it all.

This was a pivotal year for Atari. The company started the year rapidly restructuring to finally offset the losses incurred in previous years. Their hopes were pinned on their new 64-bit super console, the Jaguar. It was launched, the press (except *Edge*) loved it and then... nothing happened. Games were promised and previewed, but few cartridges flew on to the shelves. Yet people's faith in Atari led them to buy the machine anyway and wait for *Tempest 2000* and *Alien vs Predator* to hit the shops - as much as six months after the hardware had been flogged. A

stuttering start, but a start nonetheless. Now the Jag is ready to do battle with the likes of Nintendo, Sony and Sega.

Sega? After years of courtroom bickering Sega and Atari settled this October. The result: a huge wad of cash for Atari (\$40 million), an 8 per cent stake in Atari for the Japanese console giant and the rights to 70 patents going to Sega at the cost of some \$7 million a year for the next seven years! Hurrah.

Game year

It was a quiet year for games in terms of volume, but a very loud one in terms of

quality. 1994 saw the launch of three of the greatest ST games ever: *Frontier: Elite 2*, *Cannon Fodder* and *Starball*.

In February *Elite 2* stunned us all. It establishes a huge gaming environment in which you can troddle about a highly accurate universe, killing or being killed in a dog-eat-dog, space opera kind of way. At times it pitches into dull workaday ferrying of ore about planets, while at others it's a full-on, in-yr-face space battle for survival. Brilliant.

If it was April it had to be *Cannon Fodder*. Sensible's vicious arcade war game takes the awards for sheer nasty

gameplay but doesn't win any friends for its unobtrusive approach to the subject. The little cartoon soldiers are killed, bleed a lot, and if you shoot their still-twitching bodies you can usher them around the map. Not pleasant, but spookily realistic. As well as the gratuitous gore, each of the assault missions elegantly blends high-speed mouse reactions with tactics - a heady mix.

Starball surprised everyone in October. It's PD/shareware and yet still blindingly good. Just load up your *Starball* disk (ST FORMAT 64a) or look at this month's Gamebusters (page 78) for

august

proof. Written to, if not above, the level of commercial releases it looks slick, sounds great and plays brilliantly.

Word wars

Word processors have a cosy image of vicars typing out their parish newsletters or wannabe Jeffery Archers writing the great British novel. Not so. This year saw a brutal slugging match, with the three biggest players in the field going at each other like Royals in a tabloid.

Protext 6 stole a march on its opposition by being released way back in January. It was ready to be updated in October, when things got nasty. *Protext 6.5* met *That's Write 3* and *Papyrus Gold* in a head-on clash.

Protext is for the traditionalists; it's powerful but lacks elegance. *That's Write 3* and *Papyrus* change all that. These two processors could happily sit on any machine, in any office, anywhere. They look professional and powerful. *Papyrus* steals the march slightly, being even more friendly and intuitive than many a Mac or PC word processor, despite costing a fraction of the likes of *Microsoft Word* or *WordPerfect*. These

programs are indicative of the kind of software you can expect to see on the ST in the future. As programmers get to know the machine better and user needs become better defined, the software gets more coherent and user-friendly. With drop-down menus and non-modal dialog boxes you can configure these programs to do exactly what you want, the way you want.

Public utilities

The ST was taken another step further, this year with System Solutions' triumvirate of *Kobold*, *MagiC* and *Ease*. Together they redefine the way your ST works. *Kobold* deals with the file management side of life: it's fast, functional and highly usable. Running with the *MagiC* multitasking system it becomes even more potent. *MagiC* is the best multitasker on the block, more flexible and faster than Atari's own MultiTOS. When *Ease* trots out the set will be complete, and the Desktop will be replaced. Will the ST ever be the same again? No, it'll be better.

The other stars of the year were *Harlekin 3.1* and *Diamond Back 3*, and

hard drives increased in power and value. *Harlekin*, released in April, does everything: file selector, text editor, file spooler, RAMdisk, disk formatter, the works. For a mere £60. *Diamond Back 3*, from HiSoft, takes the ideas behind *DB2's* strong, sturdy back-up utilities and applies 1994 standards to them: programs must look good and be friendly to the technically inept. It's rugged and just won't fall over, while doing its job fast and easily.

The value for money offered by hard drives increased through the year. The Progate offers 85MBytes for £299, coming with good formatters and running really rather fast. System Solutions' MiniS drives offer a mighty 105MByte option for £299, and a further 135MBytes for another £100. Gasteiner hit back in August with 170MBytes of SCSI drive for £299. Prices continue to fall, while storage space increases.

Essential reading

1994 saw an increase in terms of intensity in the ST magazine scene. The long-running *ST User* finally bit the bullet, leaving two titles on the newsstands.

Well, actually, it merged with a rival, but 'bit the bullet' sounds so much more dramatic. *ST FORMAT* is still the biggest selling (and we'd say best) and remains committed to the ST.

ST FORMAT itself underwent change too. Paula departed for *PC Answers*, Clive was sucked into the .net and Jon Nash went upstairs to join the wacky bunch of funsters that form *Amiga Power*. Joining the team was Nick Peers, a bitter but decent disk editor; Simon Forrester, a hairy all-round code-head and Jill Werb, World Elk wrestling champ and deadly production editor. Oh and there's me. I make a mean cup of coffee, as long as you take it white. With two sugars.

We'll continue the *ST FORMAT* mission: to inform and entertain ST owners. We'll bring you the latest news, best previews and reviews throughout 1995. We'll track down important pieces of code and have the full program or at least a demo on the Cover Disk. We'll run features on new and different ways to use your ST, and how to make the most of those tricky but truly wonderful applications. We'll be here. Join us.

ORDER THREE BACK ISSUES AND GET A FREE BINDER

If you have stacks of *ST FORMAT*s littering your desk and you're about to get some more then why not get yourself a simply smart binder to keep them all in? Obviously if you go for our three back issues deal you'll get a binder free, but if that's not the bag you're

into why not avail yourself of our splendid binder offer? You can get one for a mere £5.95, or two - yes he said two - for £10! Go on. It'd be rude not to. Just tick the relevant box on the order form when ordering your back issue(s).

CLASSIC ST FORMAT

£4 EACH

Did you miss an old *ST FORMAT*? Is there a Cover Disk you need? Take advantage of our back issues offer and get three copies of *ST FORMAT* and a binder to store them in for only £10! All you have to do is tick the issue

number(s) you want on the order form below and post it straight away, before you forget. You don't even have to pay the postage if you're in the UK. Go on, get yourself a piece of ST history while you can.

STF01/95

COOMBE VALLEY SOFTWARE

EDUCATION ADVENTURES £16.00

Written by experienced teachers Each

MATHS DRAGONS. Ages 5 - 12+

Designed to give practice in the four rules of number. Sum type and degree of difficulty can be selected. Set in the caverns of the Maths Dragons, you must rescue the scattered pieces of your train set from the attentions of the baby dragons.

REASONING WITH THE TROLLS. Ages 5 - 12

You play the part of the Smallest Billy Goat Gruff, who wants to get to the other side of the river where the grass is greener. In order to get there you must cross a number of bridges, each with a resident troll. Safe passage will depend on your answers to a set of graded, reasoning questions.

TIDY THE HOUSE. Ages 5 - 9

A first adventure game, set in the familiar territory of an untidy house, where the player must get their younger brother and sister ready to go out and do a bit of tidying up at the same time. The game helps develop reading and keyboard skills, plus logical thought and planning.

TIME FLIES. Ages 5 - 13

Father Time has gone out for the day, leaving you to dog sit the Watch Dog. He's easy to look after, just give him his food and water and take him for a walk and he'll be happy. It's a pity the Time Flies have got loose but if you are good at solving time problems, they shouldn't be too much trouble. You set the type of problem and level of difficulty.

CAVE MAZE. Ages 8 - 13

A first adventure for a slightly older age range. You have befriended a lost, hungry and slightly awkward, baby dragon. All you have to do now is find his lunchbox, feed him and then guide him home past the obstacles in a maze of caverns. The game helps develop reading and keyboard skills plus logical thought and planning.

PICTURE FRACTIONS. Ages 7 - 10

This game is designed for those who have just started fraction work and who are not yet ready to deal with them in purely numerical form. Questions are presented in the form of pictures from which the player must work out a fraction and then answer in either word or number form.

FRACTION GOBLINS Ages 8 - 13+

A game which gives practice in fractions. Any or all of the rules of number can be selected, as can the difficulty level and type of fraction. The simplest level will allow the most hesitant novice to succeed while the hardest will probably require pencil and paper no matter how good you are.

FEEDBACK

Having gorged itself on your opinions and comments, all that stands between this behemoth of a page and the sleepy village of *ST FORMAT* is Trenton 'Grant' Webb.

Personal Problems

Dear *STF*

I have found a problem when decompressing *Personal Pascal*. When it does decompress there isn't enough room on the disk for it and the PASLIB file gets chopped, leaving a Read error when linking in *Pascal*. To correct the problem, follow these instructions:

- 1) Get your blank disk
- 2) Copy DOSACC to the Cover Disk using the Menu
- 3) Re-boot so DOSACC installs
- 4) Activate DOSACC and format the disk as extended format
- 5) After formatting put in the *Personal Pascal* disk.

■ Having trouble decompressing *Personal Pascal*? Fret no more!

Now decompress *Personal Pascal*. You won't have this problem if you have a high-density drive, or decompress on to a large RAMdisk or hard drive.

Adam Robinson, Leicester

stf: Cheers for that advice Adam. For an alternative method of decompressing your *Personal Pascal* (*ST FORMAT* Cover Disk 64b) see this month's Disk pages which start on page 6.

A right card

Dear Trenton

Could you inspire a programmer to produce a program similar to *Printmaster Plus* (from Unision World) but with colour graphics and borders. This would mean that Atari users could make things like greetings cards that utilised A4 paper, not slightly larger (as per sample from *Printmaster Plus* enclosed).

F Edmonson, Burnely

stf: Well I can't, but your plea may be answerable by other readers. Come on folks, anyone out

■ *Award Maker Plus* (see PD Sector) supports colour printing, but only of certificates, not greetings cards. Sorry!

there got a solution to Mr Edmonson's troubles?

STACKs of games

Dear *ST FORMAT*

Some time ago I had *STAC* (*The ST Adventure Creator*) but it broke and I couldn't load it at all. Then in

issue 63 I noticed that you talk about *STAC* and other game creators. Is it still possible to get hold of it? I have been looking for *STAC* ever since it broke but I can't get hold of it. Could you help?

Michael Tedstone, Glasgow

stf: There are no supplies that we can find directly, but keep your eyes on the Reader Ads section on page 70 or even send in your own appeal. It won't cost you a penny and it might find you a copy.

Clarissa Explains It All

Dear *STF*

I have been a subscriber to and purchaser of *ST FORMAT* since the first issue of *ST Amiga FORMAT* many years ago. It was good to see on the November issue that there was a useful utility (programming language) included that would run on a 512K machine, as I have an unexpanded 520STFM. Keep up the good work and continue to support lesser machines.

Now for a 'gem' of information! There was a picture at the

MUNCHIES

To Trenton 'Grant' Webb
Hi, first let me thank you for your review of my program *Munch*. It's nice to know that I have not spent the last year and a half on something totally useless! There are two things I would like to point out though.

Edward Munch was a Norwegian painter. We haven't got that many, so we at least need credit for him (he's the one with the *Scream* painting, so at least you got the miserable part right).

Also, you never stated in your review that *Munch* can work with pictures up to 2,500x3,500 pixels in size! As this is a feature not found among many of its competitors I feel it is an important to point this out. This means an A4 page in 300 dpi resolution can be worked on.

Since *Munch* was sent to you I have written another program

for registered users only, called *Madonna* (after another painting by Munch) - a GDOS-based printing program. GDOS, NVDI and SpeedoGDOS can all be used.

Currently I'm working on *Munch 2*, a total rewrite of the entire program. It will be Multi-TOS compatible, GEM-based, run in all resolutions greater than 640x400, in colour (although it will still be a mono program) and do weird things to SpeedoGDOS fonts. It will also have many more tools. I hope it will be finished this winter, and all registered users will be entitled to a free update.

Greetings from Norway
Vegard Hofsay, Trondheim

stf: First things first. You don't get *EastEnders* out in Norway do you? Next - okay, you got us banged to rights, *Munch* was in

fact Norwegian. Sadly all our GCSE Art History lessons failed us and all we knew was that he was from 'somewhere up north'. More importantly we couldn't name another painting he'd done, which means that you answered two of our questions in one letter. Hurrah.

Good shareware programs like *Munch* underline the benefits of registering programs. What a brilliant offer: a *Munch* upgrade and access to *Madonna*. Now that's worth £22 of anyone's money (Visa, Mastercard and Eurocard are also accepted). Get yourself an International Money Order and send it to: Vegard Hofsay, c/o SA Jensen, 3630 Rodberg, Norway, or see the REGISTER.DOC file on the *Munch Wonder Disk*. The program can be also obtained from Ad.Lib BBS on ☎ 0191 370 2496.

■ Our production editor on deadline day. Er, sorry. A famous painting by a Norwegian painter called *Munch*.

■ Sadly Trent's only claim to fame is that he once invited the now Miss World (Miss Trinidad and Tobago) to a party. She never came. Odd that.

bottom of page 42 of the November issue of two people you didn't recognise. The girl on the left is an 18-year-old American actress Melissa Joan Hart, who's on Sky in a programme called *Clarissa Explains It All*. I assume the bloke in the picture with her is one of her fans. I thought you might like to know that!

Roger Shrimpton, Aylesbury

stf: We aim to please with our Cover Disks, and always try to ensure that as many ST users as possible can use the programs we put on it. As for the info on obscure but no doubt quality TV, that's always appreciated.

ST FORMAT is read by thousands of people every month, and some of you must have great trash TV claims to fame (a limp-on part in *Casualty* or perhaps 23rd round-head from the left in the Weetabix ad). If you have, go ahead - share your 15 seconds of fame with the ST world. Why? Because you can!

Dyn and blast it!

Where can you get two STE joystick adaptors so that you can plug joysticks into the two extra ports on the side? I've just bought

■ Dynabusters, the Gold-rated multi-player blow-'em-up from last issue (see page 88 if you missed it). Find out how to get six players going at once.

Dynabusters, which enables you to have six players at the same time. If you can't get them anywhere could you print the connections so I can make them myself.

Rob Fellows, Wolverhampton

stf: Yeah, you can obtain just such an adaptor from WeServe ☎ 01705 647000 for just £5.88. As for the connections for a home-made job, Clive's suggested we do it as a DIY project in a future issue. Well, no promises but we'll try.

Moondance

Dear ST FORMAT Since playing Moonstone on an Amiga at my friend's, I was dying to buy this gory game for my Atari 520STFM which has been upgraded to 1MByte. I tried all the companies in ST FORMAT 63 and 64, and others, only to find that the company (unknown) that made

Moonstone stopped it several months ago, but that it was out for the Atari priced at around £20-25. Is there any way of getting the game re-released, even for a short spell, or getting hold of this game?

Greg Capon, Grimsby

stf: You're a braver man than me! I wouldn't dare take on Moonstone for pleasure - it was stupidly tough. Still I think the only real way you're going to realistically stand a chance of getting hold of a copy of Mindscape's knights-and-dragons hack-'em-up is to use our Reader Ads section on page 70.

Dream letter

To STF Could you please send me a working copy of the September Cover Disk as this version has a boot sector error. Could you also send me information on subscriptions in Europe for ST FORMAT.

Martin Wardeill, Germany

stf: If I were to make letters up, this would be top of my list, although I'd probably wobble on endlessly and never quite get to the... well suffice to say I'd beat around the shrubbery for a goodly while. Anyway, it gives me the opportunity to go into 'explain' and 'market' mode. So thank you.

As with all faulty disks you have to send it back to the labs (where they're made) because we don't keep a stock of them in the office. Pop your duff disk in a Jiffy bag, along with your name and address and send it to: ST FORMAT September Disk Returns, PO Box 21, Daventry, NN1 5BU. Don't worry about a stamp - we pay the

DISK-CUSS

Dear ST FORMAT I have just gone out and bought your mag, looking forward to testing the *Ishar 3* demo you said would be on issue 62. But to my horror it was not there. I looked to see if it had fallen off but it had not and was just not on your mag. One of the other ST mags had a demo of the game but I'm loath to buy a mag just for a demo. Could you tell me where it went and if you are going to put it on another issue?

NJ Russell, Eastbourne

stf: First off, apologies for raising your hopes over the *Ishar* demo, but I hope I can explain some of the mechanics behind our disk production. Firstly we try to offer exclusive demos on our Cover Disks,

because this way you get better value. Secondly there is the question of space. ST FORMAT is a broad-based magazine, with readers interested in everything from programming through to games. If we soak up all the available disk space with one large game demo then this gives our non-gaming readers nothing and is hardly fair. *Ishar 3* fell into both these camps - not only was it was huge, but we couldn't guarantee the exclusivity of the demo, even though at the time of printing the 'next month' feature we were under the impression it was ours alone. It was also for 1MByte users only. These factors conspired against us running said demo. Sorry about that.

■ *Ishar 3* didn't appear on ST FORMAT's Cover Disk for a number of reasons, all of which are explained on the left. Now, good sir, if you'll just let me past, I'm late for the Annual General Meeting of 'Mad Looking Warriors' in the Dog and Duck Tavern across the street.

■ We could fill the subs' letter with wit and humour. But we don't. We use it for Wonder Disk instructions instead.

WYSIWOT?

Dear **ST FORMAT**
I am writing to correct an error made by Simon Forrester in his review of *Protex* 6.5 in issue 63. He claims that there is still no WYSIWYG feature in this program, yet I use *Protex* 4.3 and can tell Simon that there most definitely IS one! It's another reason why *Protex* is so good. Simon states that "text styles like italics and enlargements aren't displayed on screen in their final form, and instead are displayed in control codes..." an effect he says "ruins all ideas as to what the final printout will look like". In *Protex* 4.3 you can easily turn off the control codes, which results in their effects being seen in 1st Word style; so, for example, italic text is seen sloping, and bold effects are shown as bold. The only fault is

that the enlarged text doesn't appear enlarged, but since this is only used for headings it's not really a problem. In all other respects *Protex* is WYSIWYG!

I suspect Simon's slip up comes from his admission that he has not "experienced anything other than the original release version to any great extent". It's no wonder that he rounds up by saying that *Protex* is a "reet pig to master". I personally have always found it to be one of the easiest, most flexible and natural word processors to use. The text on screen is almost exactly what you will get when you print it out.

Christopher Hester, Shipley

stf: Well yes. Simon was in fact referring to what can only be described as 'true WYSIWYG'

where the look of a document on screen is exactly the same as what pops out of the printer. *Protex* 6.5 is not WYSIWYG because to work at its best it really needs to run with control codes rather than the straight facsimile (although this is optional), and also because pictures imported into the document are not displayed.

As for his comments concerning the unfriendliness of the package, he is right, but so are you. The power of *Protex* makes it a fearsome text-cruncher - and one of my personal faves - however for those used to packages like *That's Write* it is an intimidatingly brutal interface. Once you get the hang of it, though, *Protex* proves to be one of the most truly flexible word processors going.

postage. Naturally overseas returns will take a little longer but they will get to you.

As for Europe, you can subscribe for the bargain price of £60.95 and the whole package - magazine, Cover Disk, subscribers' newsletter and Wonder Disk will be airmailed to your door every single month. For more details on subscriptions see page 72.

Come clean and prosper

Dear Trenton
Having read the feature in *ST FORMAT* issue 64 about demo groups, I just want to clear up the comments that demo groups should produce games and utilities rather than non-interactive material. A number of demo groups are producing or have produced software (both utilities and games). A number of new games coming out such as *Obsession* and *Utopus 2* are made from demo groups. Aggression, for example, spent a lot of time producing demos and are now producing games.

Another point to bear in mind about software is that even though there are not many large software houses left producing Atari software, there is a large amount of new software available through the shareware system. For £5-10 you get a lot more from the people that produce the software, and they also offer a lot more user support and free upgrades for their software. I have sent off to several shareware programmers and the response I have received from them has been excellent.

Giving shareware programmers a donation shows that they get something in return for their

work. The software is also five times cheaper and sometimes a lot better than full-price software.

Philip Konlack, Nairn

stf: Too right. Our demo feature sought to explore the reasons why people still seem to focus all their efforts on non-interactive programs. *ST FORMAT* encourages this kind of coding, because it is an excellent arena in which people who are developing their coding skills can gain valuable programming experience. However considering most of the programmers in the demo scene appear to be fearfully capable coders, it's a little galling to have our appreciation limited 'ooohing' and 'ahhhhing' at their latest creation.

As for shareware, you could not be more right - it's the ideal way to buy software. It's written by machine-specific experts and comes with a great deal of close customer support. The shareware market is far from rosy though, with an increase in piracy and code theft (see our full report on page

74) despite the good intentions of the authors and the ridiculously low price of the programs.

Pay now, play later?

Dear Sir
I've come across an old issue of *ST FORMAT* (May 1992) in which you had a campaign for more games on the ST. I don't know if anything came of this but two of the games mentioned therein (*F-117A* and *Secret Weapons of the Luftwaffe*) have definitely not appeared. It appears that games publishers have abandoned the ST, their reasons including a small user base and piracy.

Do you think companies would be more willing to produce games for the ST if owners were to pay for the games before they were released? This way companies would have an assured order and us ST game players would get some great games.

Perhaps if a magazine (hint, hint), ST dealer, User Group or

even a reputable PDL were to support/organise such a scheme the games publishers would be willing to listen. Obviously this would be far more involved than I am making out, but there must be a way, surely? The number of titles would be limited to a few titles per month and there are more than enough titles to create demand out there. My list would include *Birds Of Prey*, *TFX*, *Gunship 2000*, to name but a few. So is there any support out there in STland?

Stuart Munro, Fife

stf: An ingenious idea, but I personally would be cautious of such an approach. Firstly paying your money in advance would leave you, as the consumer, with little or no power, particularly if the finished game turned out to be a bit of a dog. Furthermore certain games (for example) demand such high-end systems with hard drives and accelerators that the user base would indeed be limited - namely Clive. What's more, games take a long time to produce properly. I'm not sure I would be willing to cough up £30 now to get a game just before Christmas 1995 - I'm just not that patient! Would anyone else be interested in such a scheme though? Let me know. **stf**

■ England, way back when they were really good at football. In other words, before Nick, Jill and Simon were born. Tragic isn't it? (No, not really - Jill)

Make the behemoth even more behemoth next month! Write in and have your say about anything to do with the ST, *ST FORMAT* and the eternal RVF vs RF900R debate. Jot your thoughts down and send them to: Feedback, *ST FORMAT*, 30 Monmouth Street, Bath, Avon, BA1 2BW. "The world will hear from me again!"

TWILIGHT ZONE

ANOTHER COMPO?

AND NOW, FROM THE HALF-LIT world of semi-darkness (stands to reason, really), we bring you the Twilight Zone Animation Festival! That's right, it's another one of those competitions. This month sees the birth of a brand spanking new fad, similar to Pixel Painting, that gives you the opportunity to show off your work to the world. Except this one's animation rather than still piccies. All you have to do is re-read this issue's main feature, and put together a top animation of absolutely any kind, whether we've covered it here (I should hope so, or we'll be in deep trouble) or not.

The award is yet another £25, so get filming. As long as it's on an ST and it moves, you stand a chance of getting your work seen by the masses, and getting some cash into the bargain. Send your entries in marked: 'Cinematographic Contributionalisation'. What are you waiting for? The address perhaps? Oh, okay. It's *ST FORMAT*, Future Publishing, 30 Monmouth St, Bath, Avon, BA1 2BW.

PIXEL PAINTING

This periodical's piece of pixelated perfection comes from Jonathan Mortimer of Yorkshire, whose subject is the Starship Enterprise. Propeller-heads will be disappointed to learn that I can't actually quote the ship registration off the top of my head, but suffice to say it's the *Next Generation* model, with new doors 'n' everything.

Jonathan spent five hours slaving over *Prism Paint*, taking four main steps in drawing this picture, as you can see...

Jonathan had trouble getting the main hull's shading right, but managed in the end with a spray can and patience. (While I was always rubbish.)

First, he studied an actual picture to work out where the ellipses of shadow, colour change and main form were, and drew them. (Don't you just hate arties?)

Next, he added the saucer's main lights, and drew the main hull and warp engines by hand, using the zoom option. (They were always the best in art classes.)

Finally, he added the NCC 1701 lettering. Noticing the whole picture looked too false, he made the whole thing darker. It paid off. (I hated school anyway.)

DON'T MISS OUT ON ST FORMAT

MAG*SAVE

There are two kinds of people in this world. The first kind are cool, calm, collected. They live in airy apartments with polished wooden floors. They lounge around on their Habitat, off-white beds on a Sunday, eating croissants. They wear natural fibre clothing, kind of relaxed but at the same time incredibly trendy. They never get caught in the rain without an umbrella. They don't have problems hailing taxis, and they never seem to get splatted with water as cars speed past them on puddly roads. These people don't have to hunt around newsagent after newsagent, desperately looking for a copy of their favourite mag, a week after on-sale date. No, they fill in the form below and hand it to their local newsagent; the one just round the corner. Then they wander in, cool as a cucumber, and collect it. No problems. You don't want to know about the other kind of people.

Cut out this form (or a photocopy) and hand it to your newsagent. Please reserve/deliver *ST FORMAT* each month, beginning with the February issue, which is on sale Tuesday 10 January 1995.

A NEW WORLD ORDER

AS YOU MAY OR MAY NOT BE aware, Future Publishing, the home of this wonderful magazine you're reading, has just been purchased for a princely sum of £loads. The new owners are a company called Pearson, and they're the people behind the *Financial Times*, BSKyB, Thames TV, Alton Towers and Madame Tussauds. It's obvious that with credentials like that they're going to want to make a few changes to the mag you know and love:

- If you had hassle getting the larger-than-A4 mags into your

binders then it's time to start worrying - we're going broadsheet.

- The magazine will be presented by an American with wide lapels and an even wider smile.
- The screenshots will now be shot from incredibly bad, arty angles.
- We'll be carrying out in-depth studies on how to clean out negative-G vomit from a Stacy keyboard while screaming around the Thunder Looper.
- Our editor will be replaced with a life-size wax reproduction.
- But no one will notice.

...AND IT'S CRAP

On Monday 24 October, Garry Bushell wrote a piece for *The Guardian* on multimedia, opening the piece with, among others, the sentiment: "I've got an Atari, and it's crap." Well, Garry, we've read your column in *The Sun*. And it's crap.
